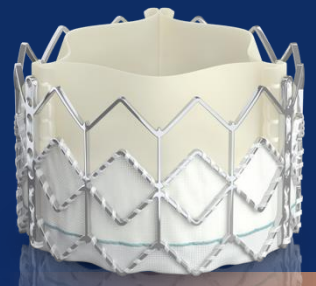
# SAPIEN 3 Ultra

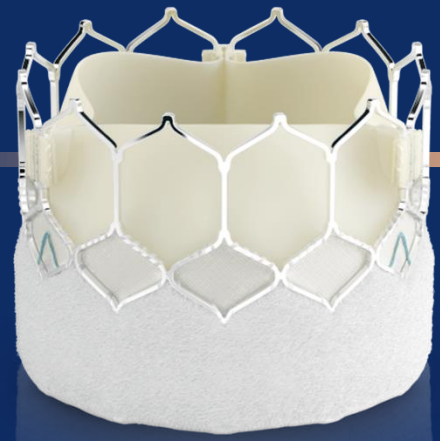
# Changes in Sapien Series



Save lives, starting with the sickest patients

Extend life-saving treatment to even more

Reset the bar to be superior to surgery



Continue to meet the emerging needs of new patient populations

Ask

2007

- EU Approval
- Start of PARTNER trial

2011 Kr → 2016 Apr → 2022 2wk Jul

Response

**SAPIEN valve**
Introducing TAVI as a life-saving treatment option for patients that are inoperable or high-risk for surgery[1]

**SAPIEN XT valve**
Non inferior to surgery on mortality and stroke in intermediate risk patients[2]

**SAPIEN 3 valve**
The only THV proven superior to surgery for low risk patients[3]

**SAPIEN 3 Ultra valve**
Further reducing PVL, reaching new patients with expanded indications[4]

# Edwards SAPIEN 3 Ultra System

: Complete range of valve sizes

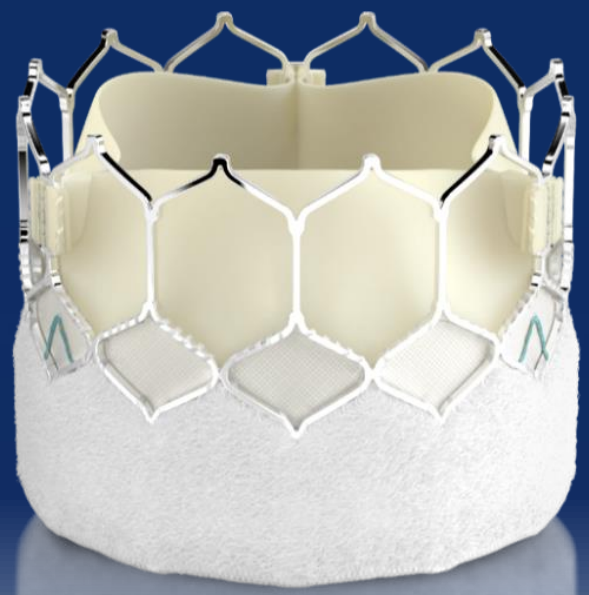
## SAPEIN 3 Ultra

| | 20 mm | 23 mm | 26 mm | 29 mm |
|---|---|---|---|---|
| **Valve** | **SAPIEN 3 Ultra** | **SAPIEN 3 Ultra** | **SAPIEN 3 Ultra** | SAPIEN 3 |
| **Native Annulus Size by TEE*** | 16 – 19 mm | 18 – 22 mm | 21 – 25 mm | 24 – 28 mm |
| **Native Annulus Area (CT)*** | 273 – 345 $mm^2$ | 338 – 430 $mm^2$ | 430 – 546 $mm^2$ | 540 – 683 $mm^2$ |
| **Area-derived Diameter (CT)*** | 18.6 – 21 mm | 20.7 – 23.4 mm | 23.4 – 26.4 mm | 26.2 – 29.5 mm |
| **Edwards eSheath Introducer set** | 14F | 14F | 14F | 16F |
| **Minimum access vessel diameter** | 5.5 mm | 5.5 mm | 5.5 mm | 6.5 mm |

*Unchanged between SAPIEN 3 and SAPIEN 3 Ultra valve*

CT, computed tomography; TEE, Transesophageal echocardiogram

# Edwards SAPIEN 3 Ultra System

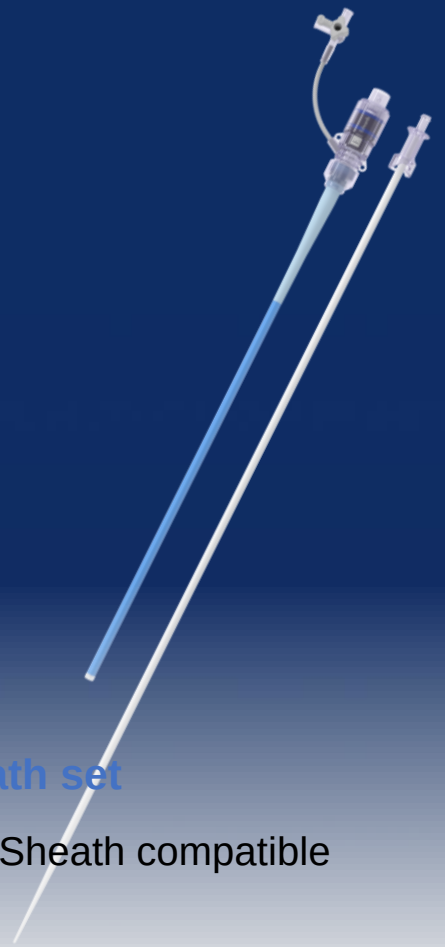


**SAPIEN 3 Ultra valve[1]**

Featuring a **taller, textured PET** outer skirt[2]

**Commander delivery system**

Physician controlled dual articulation with tapered distal tip



**eSheath set**

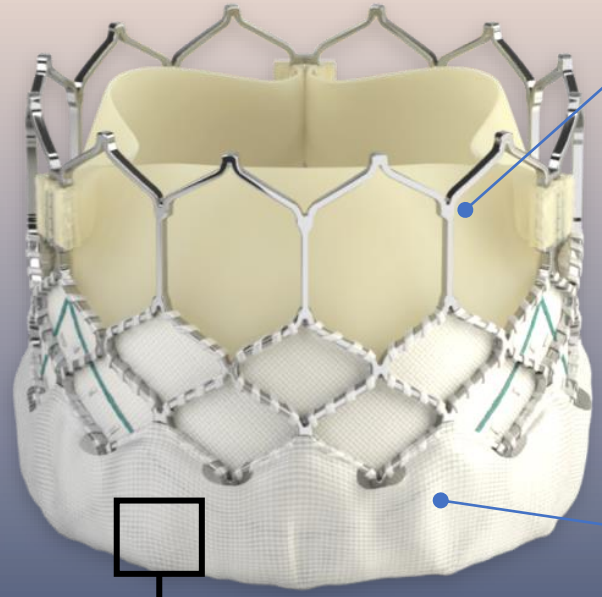
14Fr eSheath compatible

1 Available in 20, 23 and 26mm sizes
2 Compared to the Edwards SAPIEN 3 valve

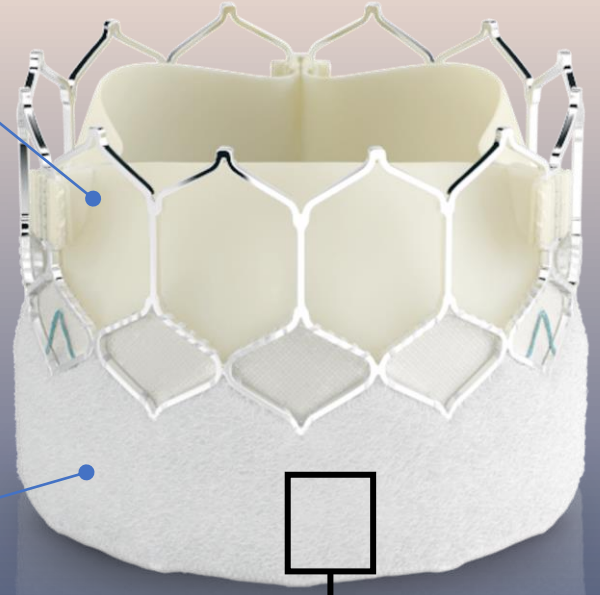
# SAPIEN 3 Ultra valve vs SAPIEN 3

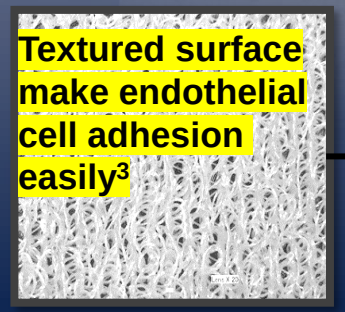
Building on the standard in TAVI to meet the needs of today

## SAPIEN 3



## SAPIEN 3 Ultra





**Same frame and leaflet design[1]**

- Cobalt-Chrome alloy frame
- Bovine pericardial leaflets
- Cell frame design
- PET outer skirt
- 14F sheath compatibility[2]

**Improved taller, textured outer skirt**

- Approximately 40% increased outer skirt height[1]
- Textured PET (↔ S3 = Flat layered)

  : Enhance healing and endothelialization[3,4]

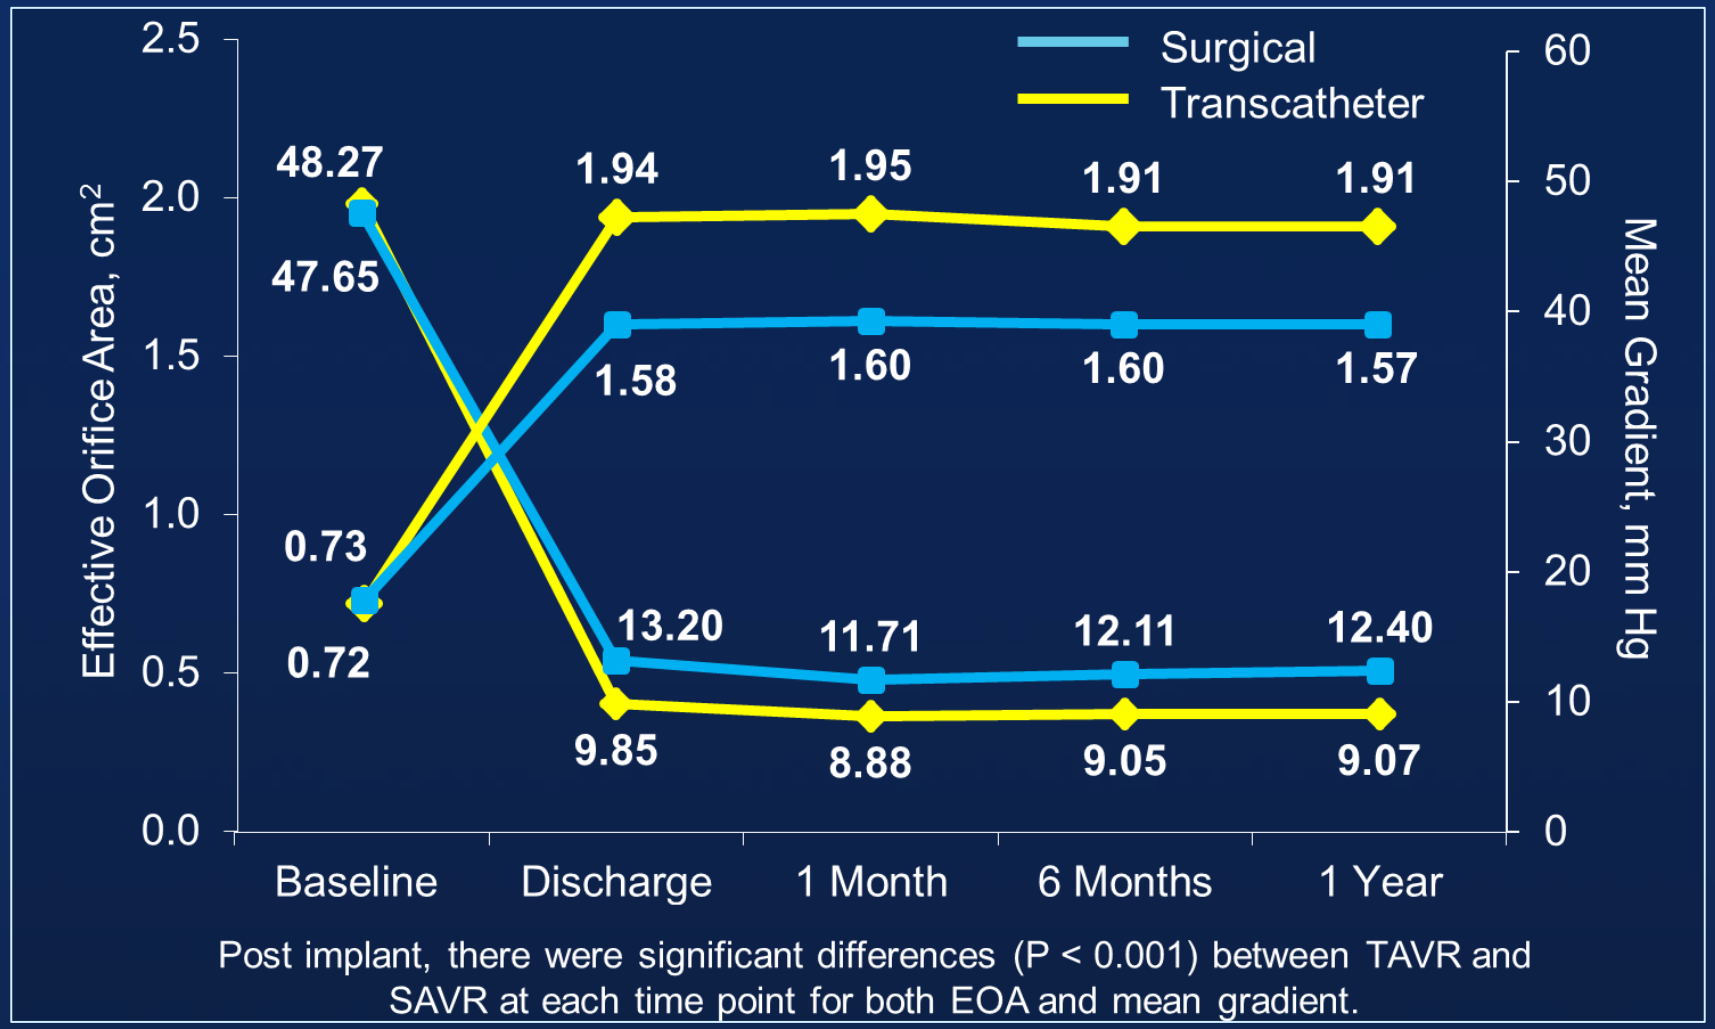
**Adams DH, Popma JJ, Reardon MJ, et al. New Engl J Med 2014; Mar 29, [Epub ahead of print]**

# CoreValve US Pivotal Trial

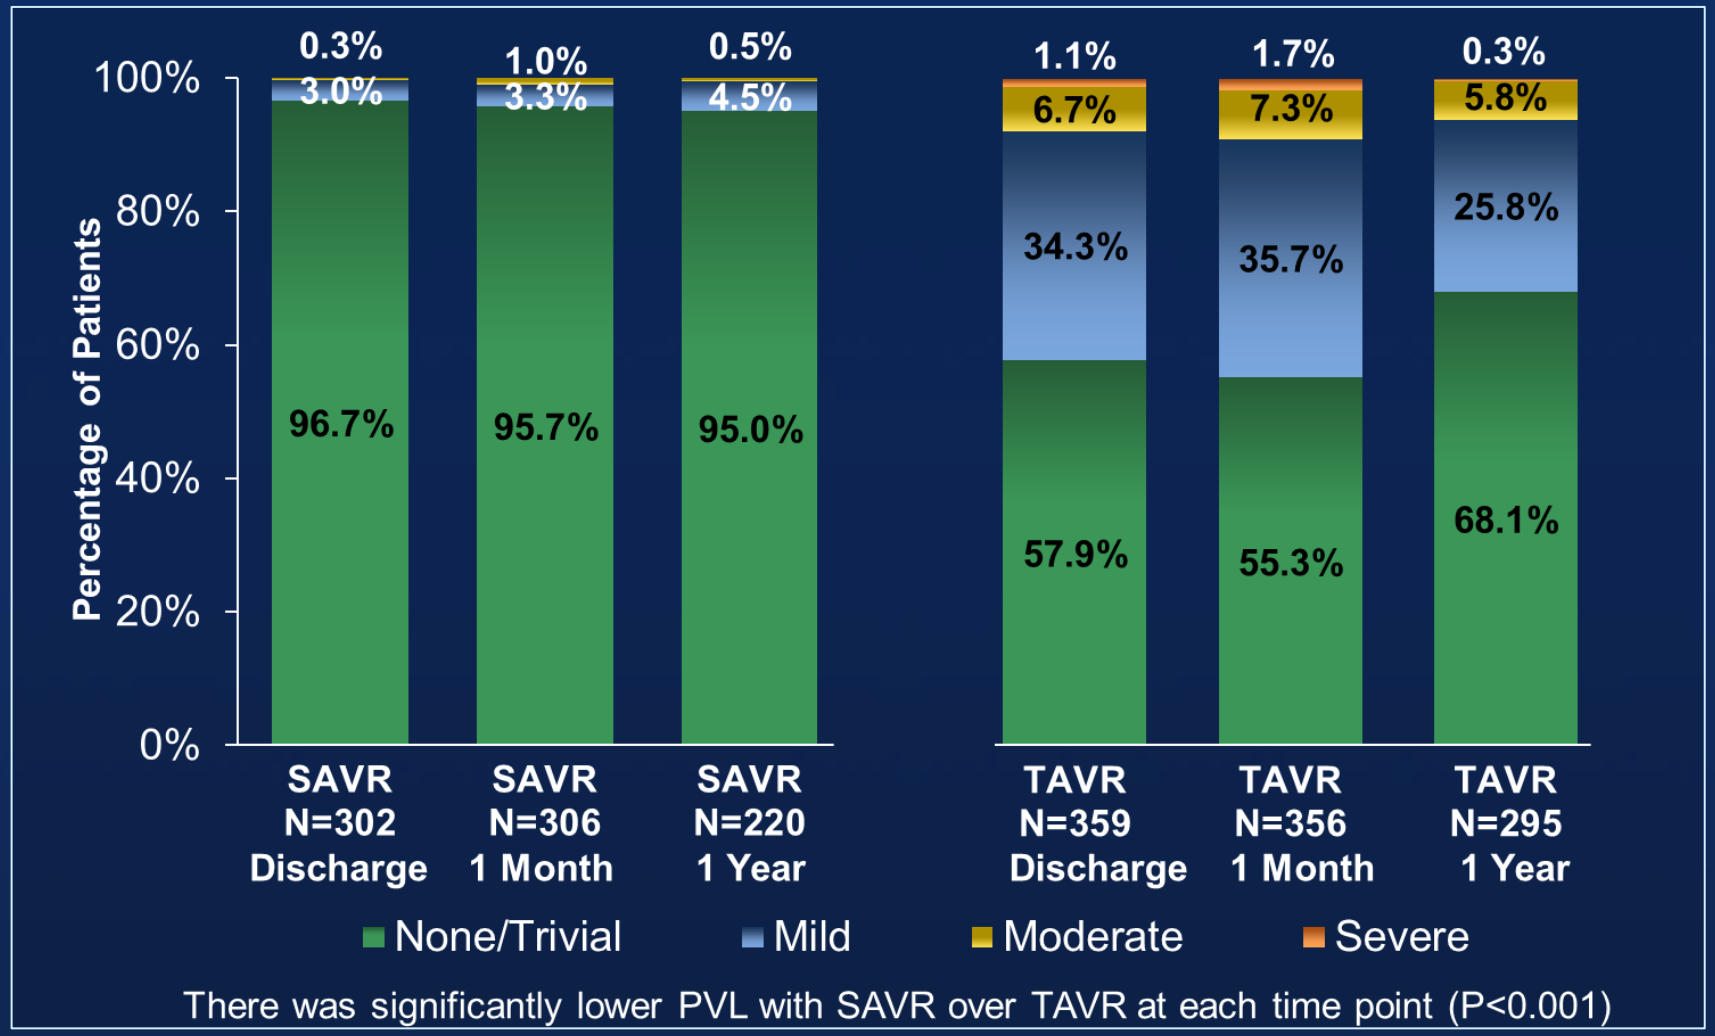
## Echocardiographic Findings



Post implant, there were significant differences ($P < 0.001$) between TAVR and SAVR at each time point for both EOA and mean gradient.

# CoreValve US Pivotal Trial

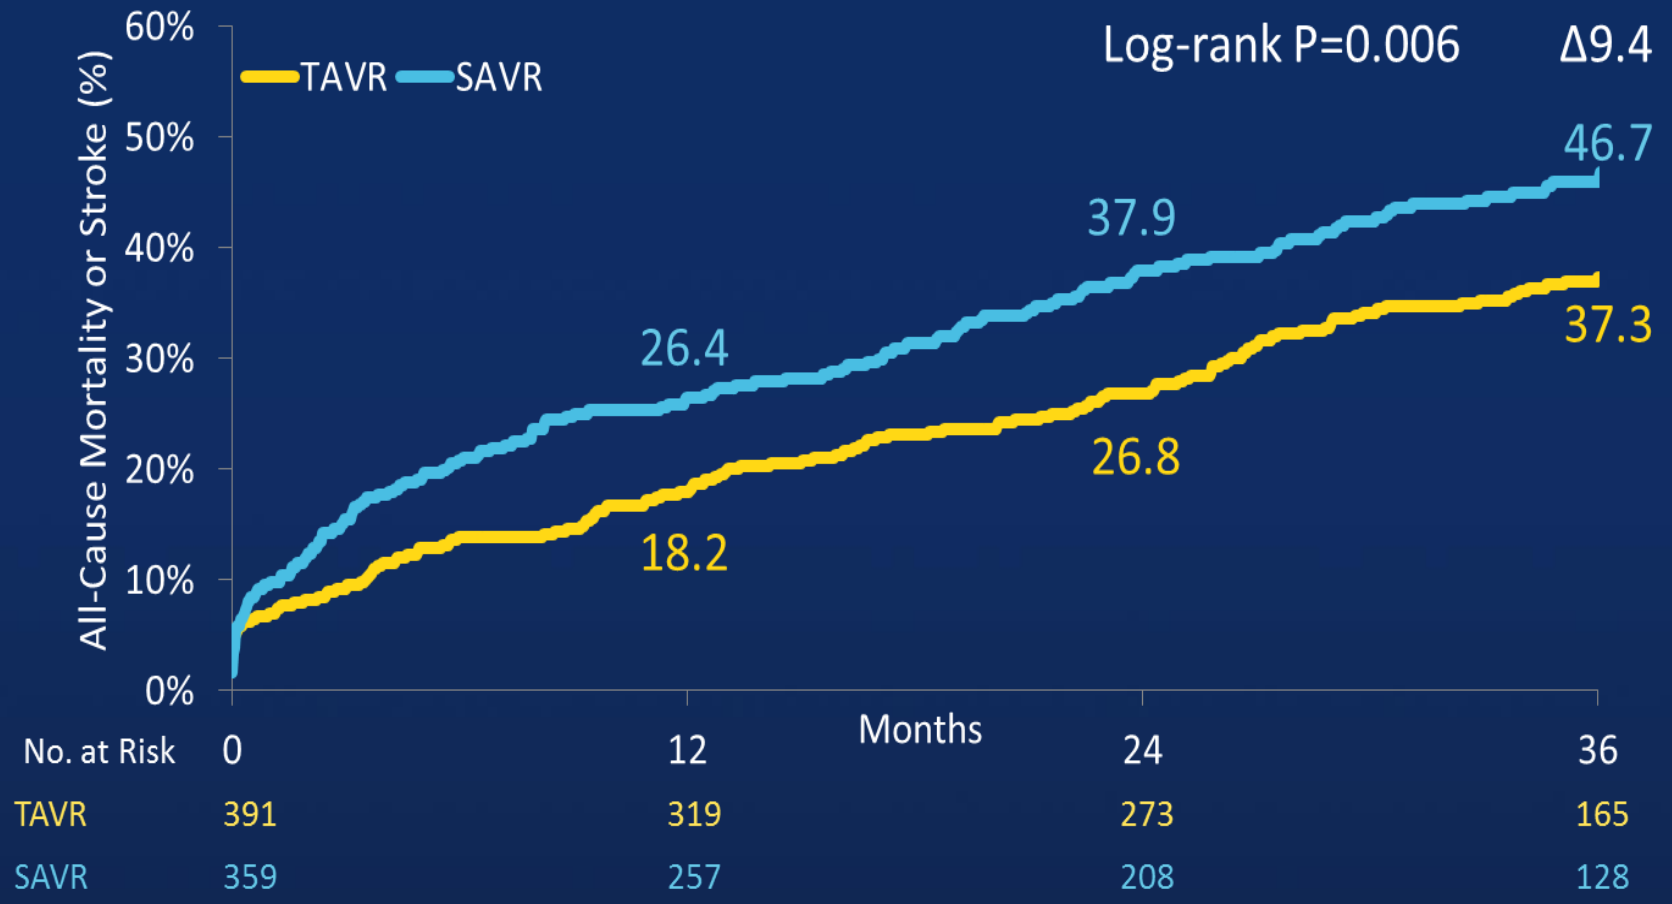
## Paravalvular Regurgitation



There was significantly lower PVL with SAVR over TAVR at each time point (P<0.001)

# CoreValve US Pivotal Trial– 3 year result

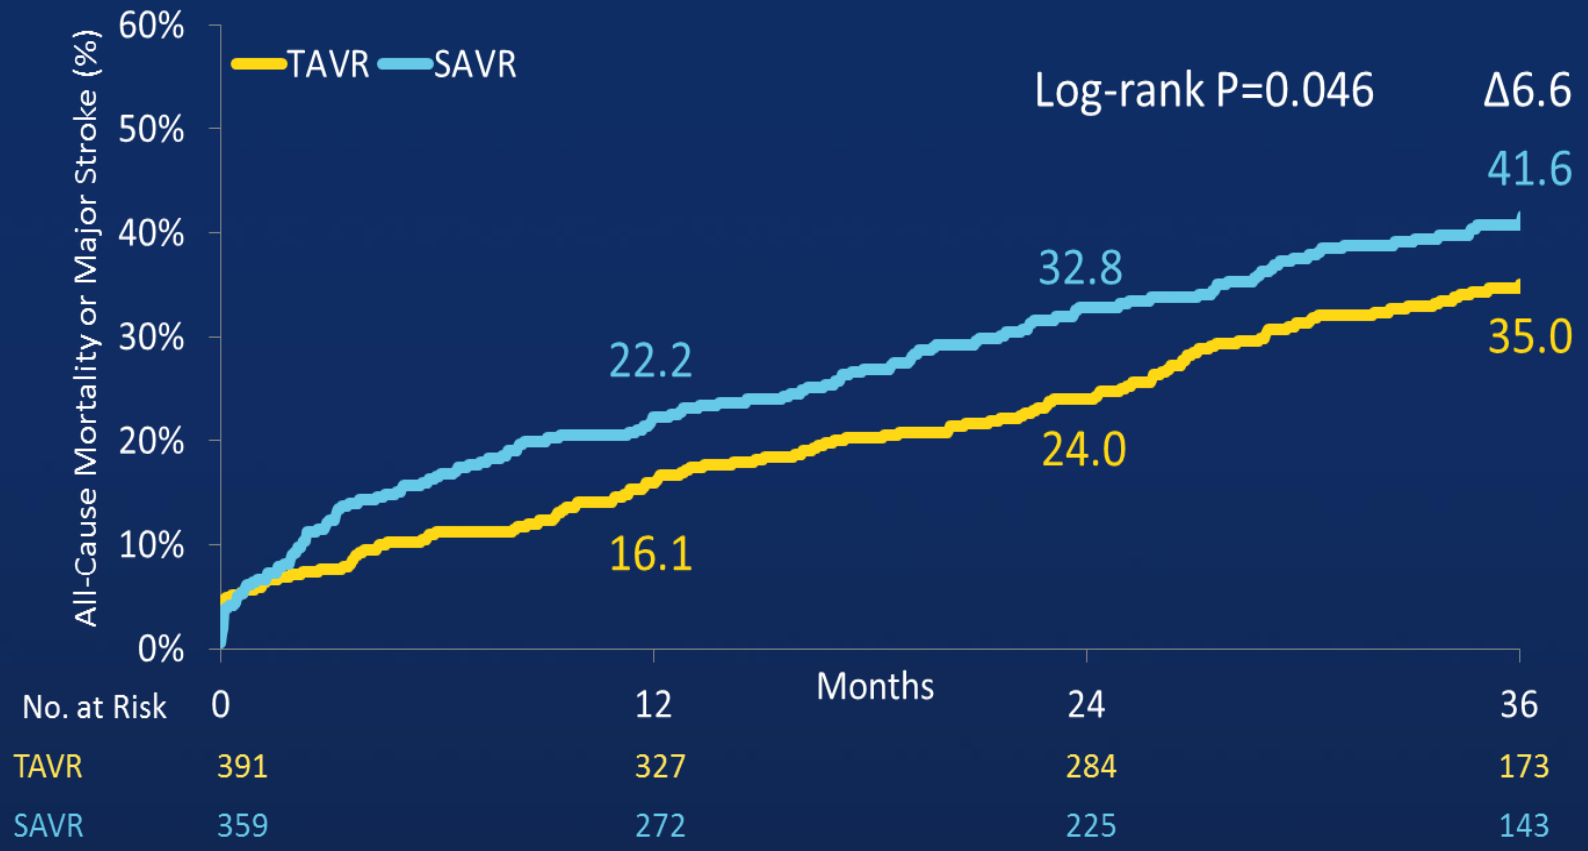
## All-Cause Mortality or Stroke



Deeb GM et al. J Am Coll Cardiol. 2016;67(22):2565-74.

# CoreValve US Pivotal Trial– 3 year result

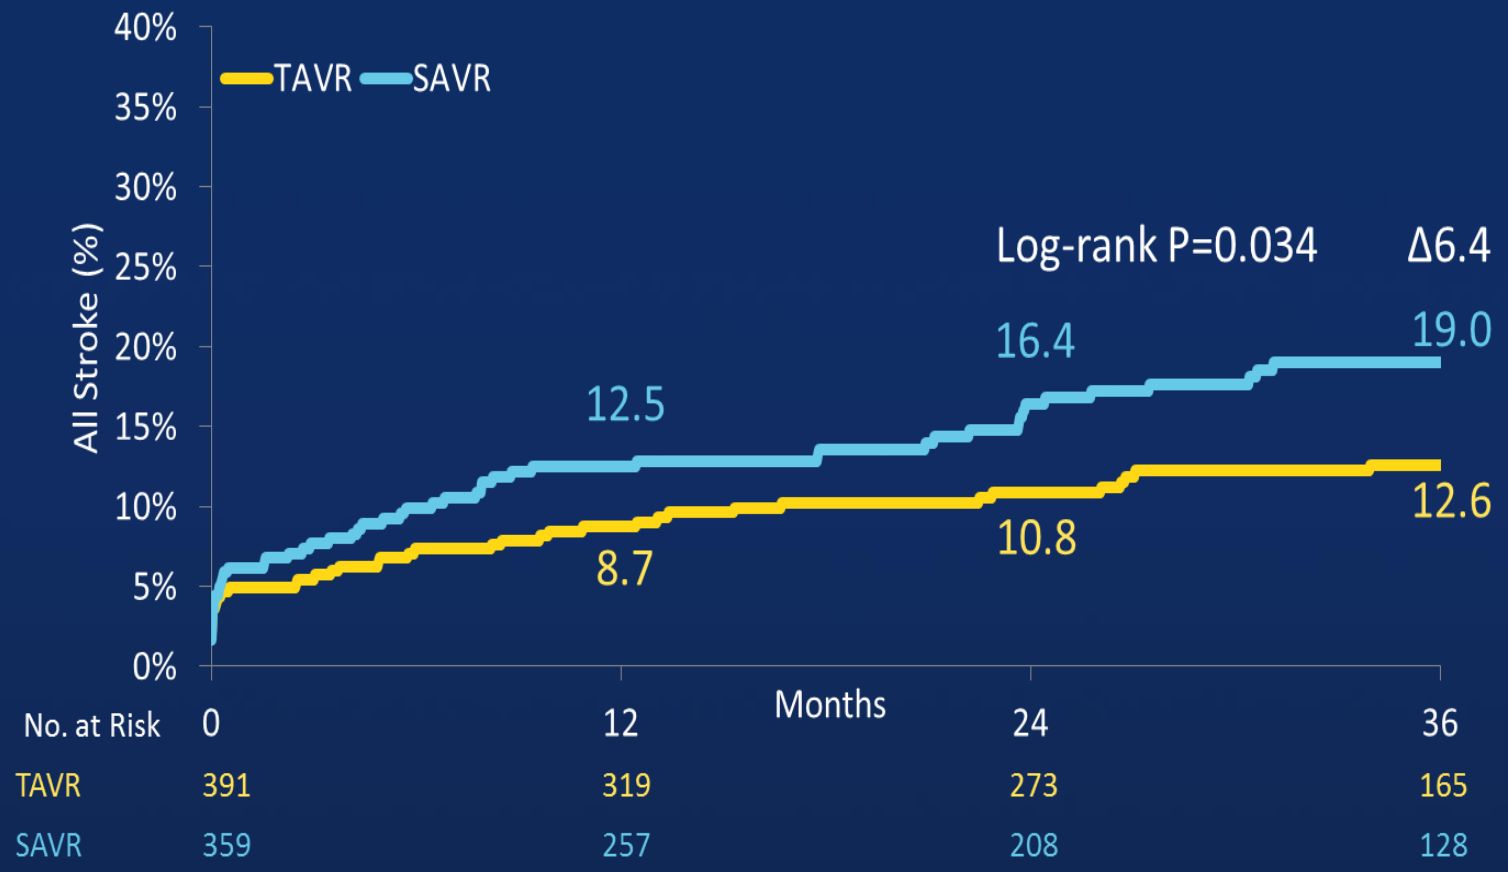
## All-Cause Mortality or Major Stroke



Deeb GM et al. J Am Coll Cardiol. 2016;67(22):2565-74.

# CoreValve US Pivotal Trial– 3 year result

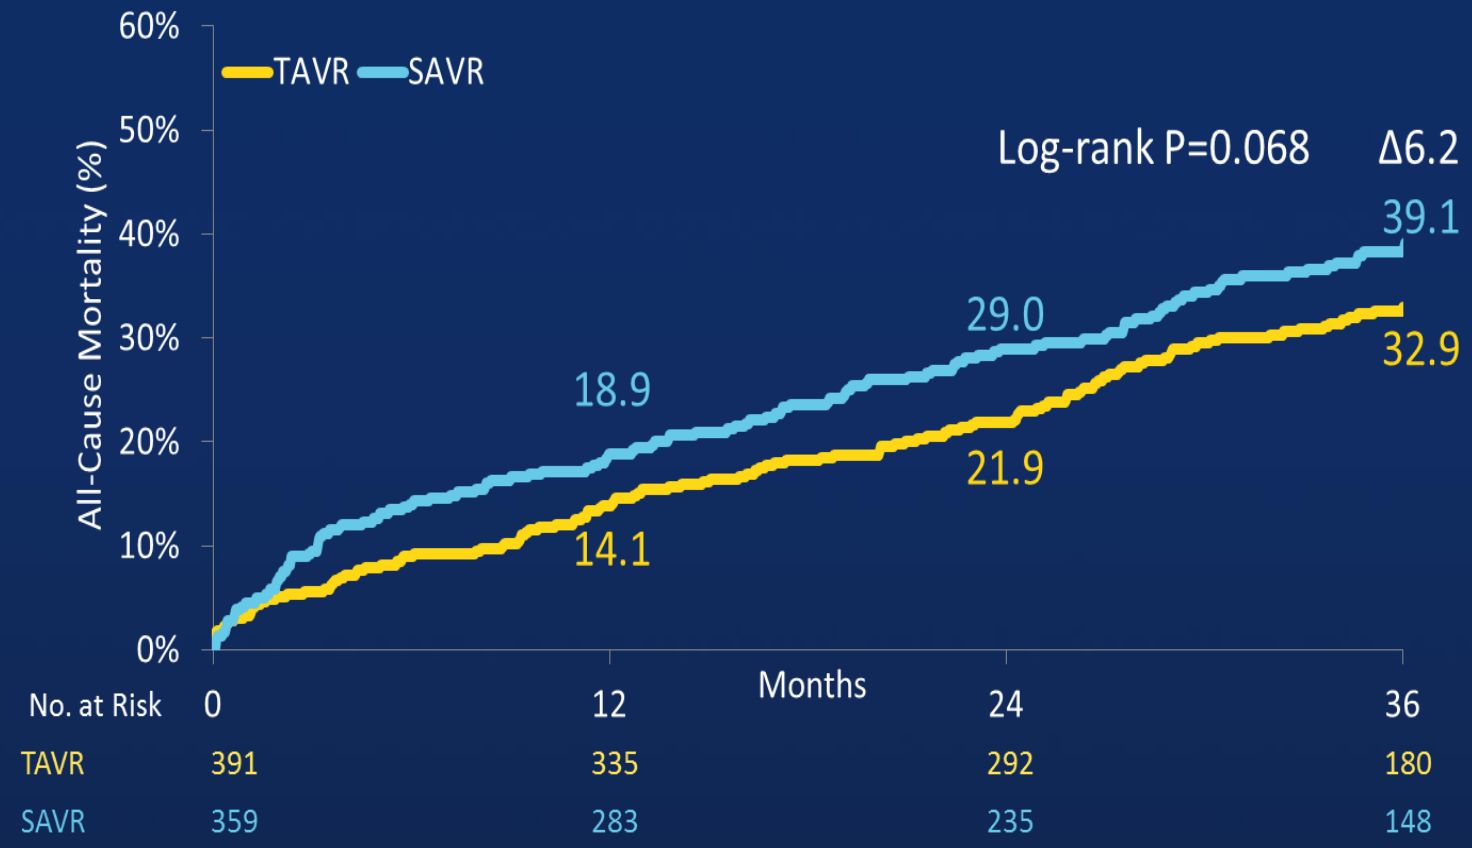
## All Stroke



Deeb GM et al. J Am Coll Cardiol. 2016;67(22):2565-74.

# CoreValve US Pivotal Trial– 3 year result

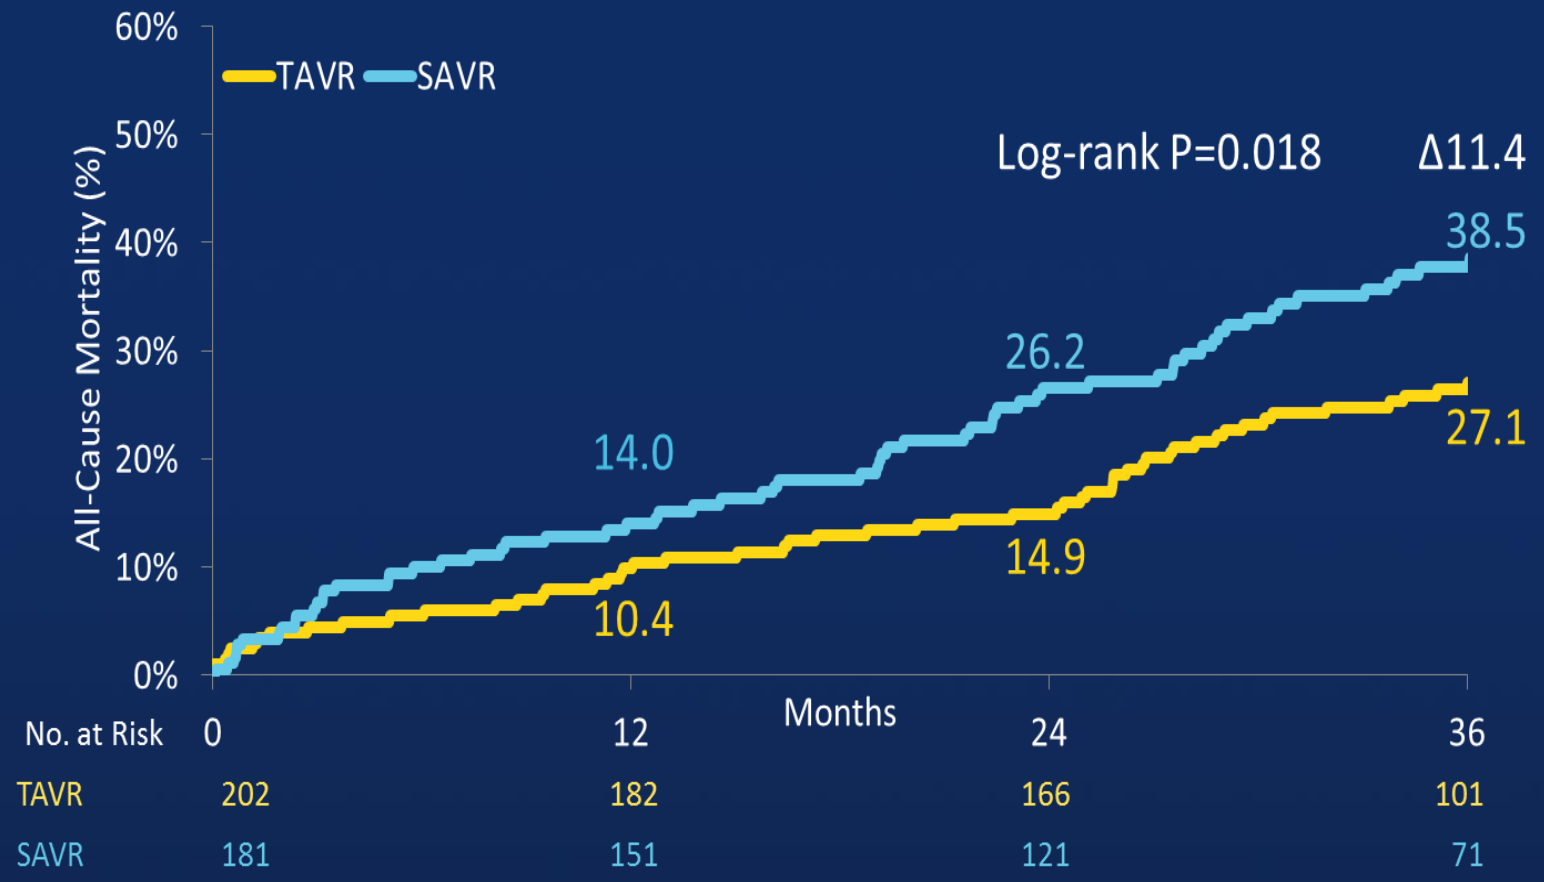
## All-Cause Mortality



Deeb GM et al. J Am Coll Cardiol. 2016;67(22):2565-74.

# CoreValve US Pivotal Trial– 3 year result

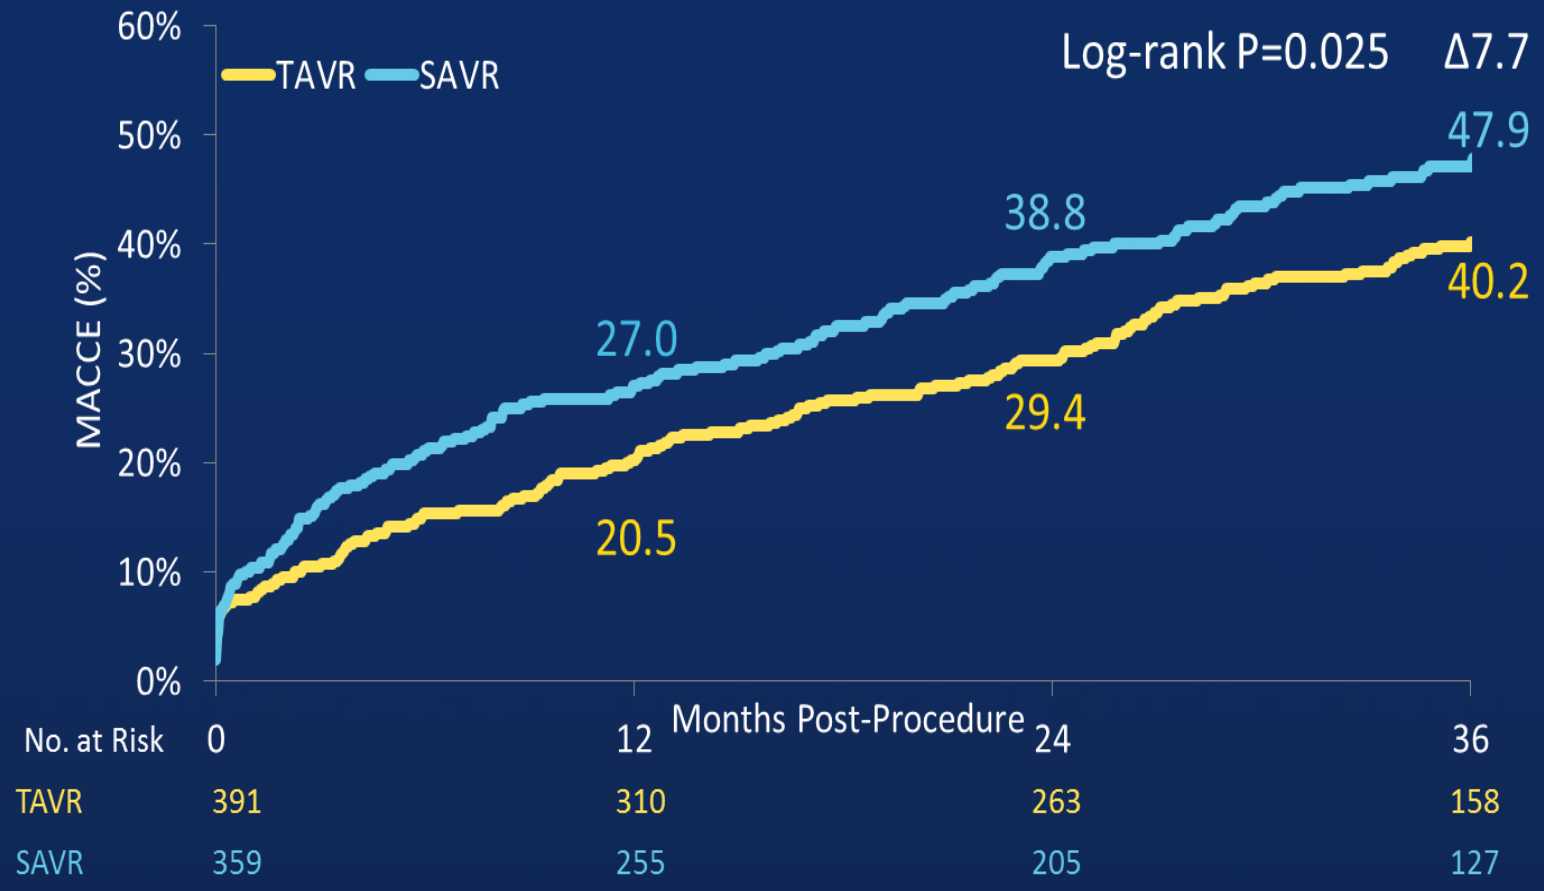
## All-Cause Mortality – STS ≤ 7%



Deeb GM et al. J Am Coll Cardiol. 2016;67(22):2565-74.

# CoreValve US Pivotal Trial– 3 year result

## MACCE



Deeb GM et al. J Am Coll Cardiol. 2016;67(22):2565-74.

# CoreValve US Pivotal Trial– 3 year result

## Valve Hemodynamics *(site-reported)*

TAVR had significantly better valve performance vs SAVR at all follow-ups (P<0.001)

Deeb GM et al. J Am Coll Cardiol. 2016;67(22):2565-74.

# CoreValve US Pivotal Trial– 3 year result

## Hemodynamic Signals *(site-reported)*

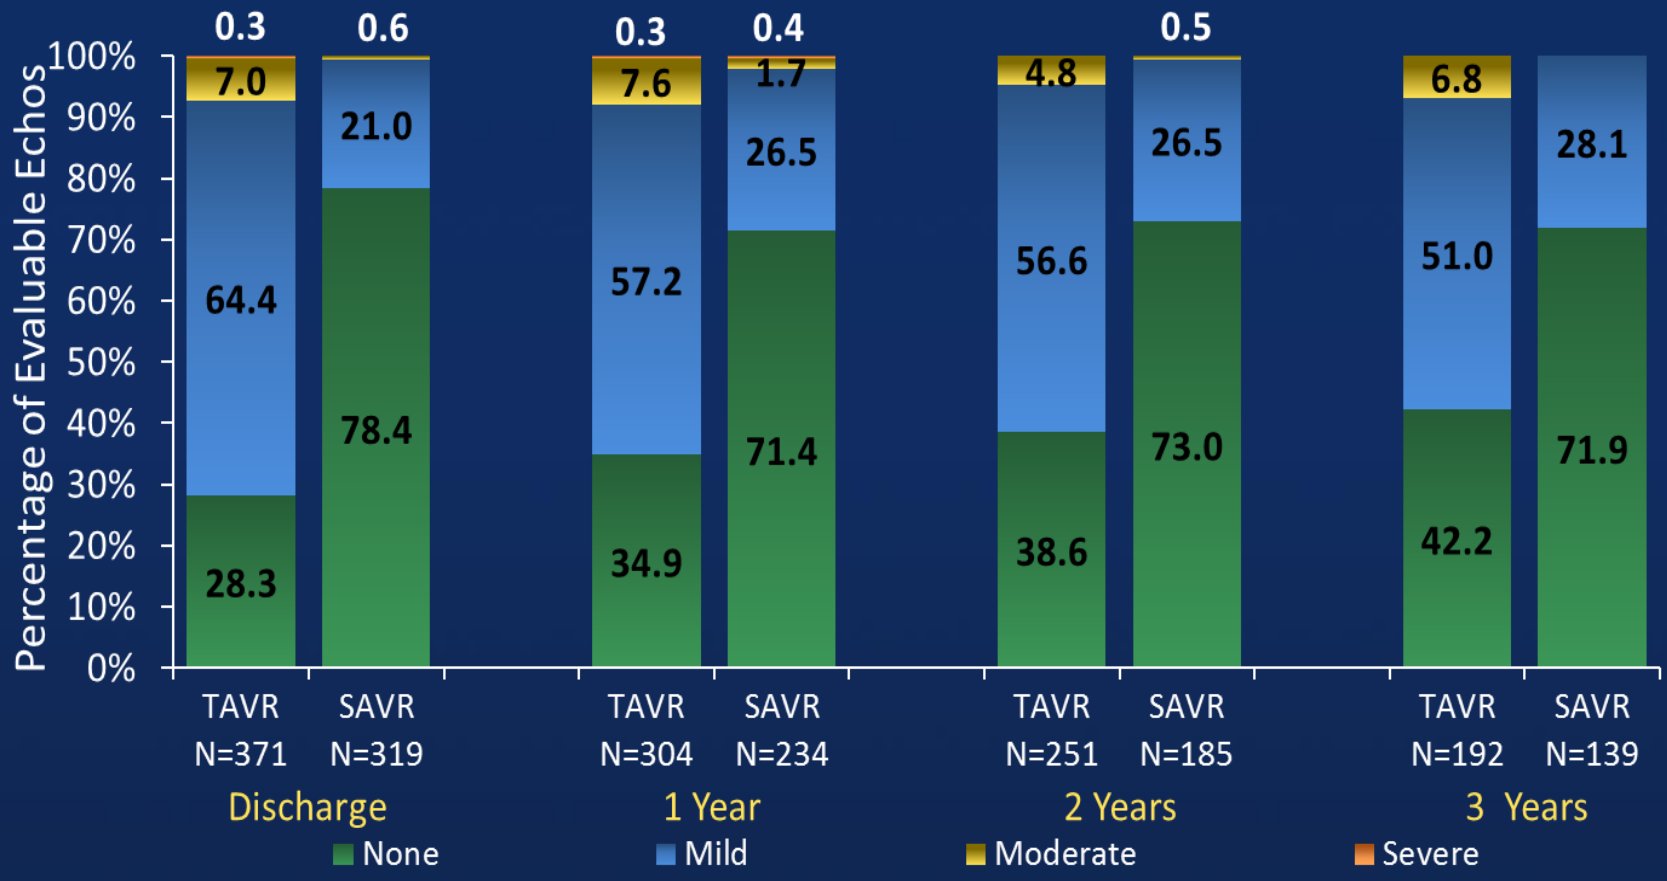
Mean AV Gradients for Patients With >50% Increase From 1 Month to 3 Years

Deeb GM et al. J Am Coll Cardiol. 2016;67(22):2565-74.

# CoreValve US Pivotal Trial– 3 year result

## Total Aortic Regurgitation *(site reported)*

Significantly less AR with SAVR vs. TAVR at Each Time Point (P<0.001)



Deeb GM et al. J Am Coll Cardiol. 2016;67(22):2565-74.

# Evolut R
# self-expandable THV

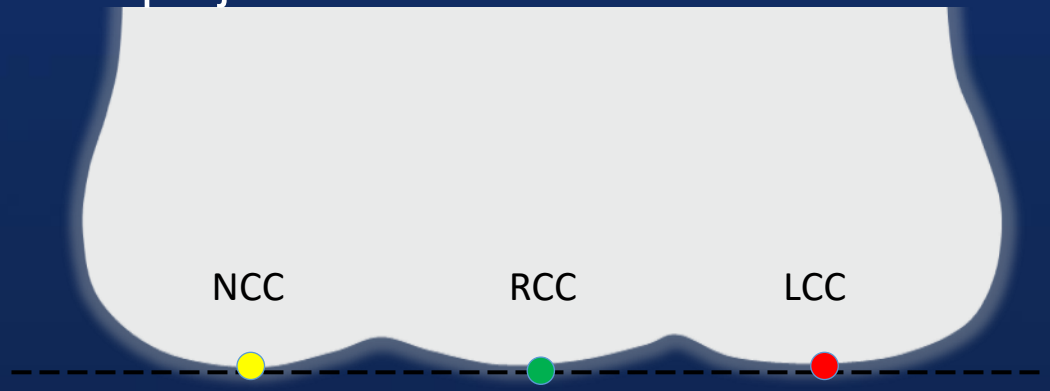
# Pre-Procedure CT Planning

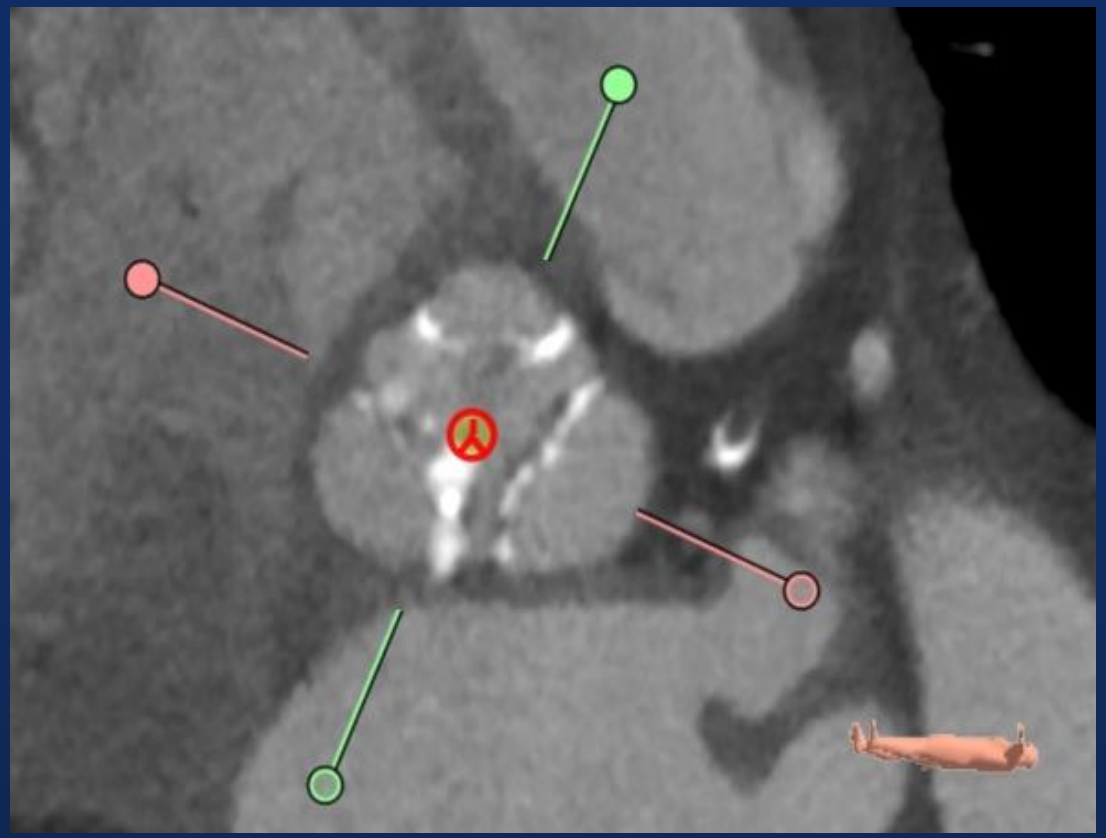
## BASAL ANNULAR PLANE

The cusp overlap technique requires high quality gated CT with contrast; free from movement artifacts and slice misregistration.

Set basal annular plane by placing markers at lowest point  in the center of each cusp in short axis view.

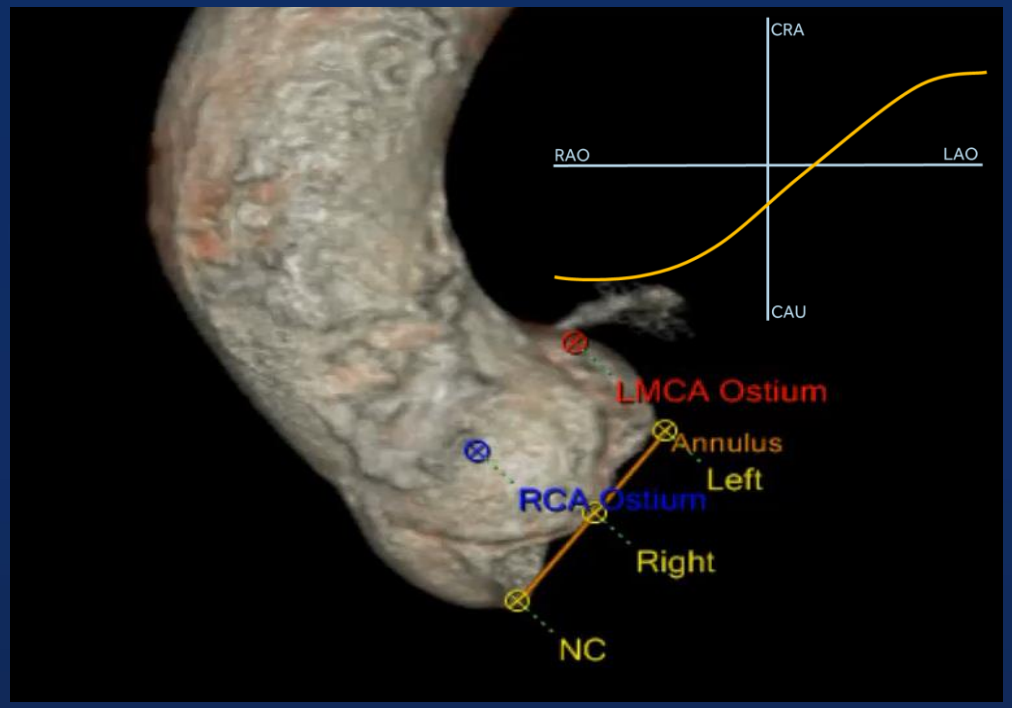
- Centering markers on the cusps is critical for CT determination of overlap imaging projections.



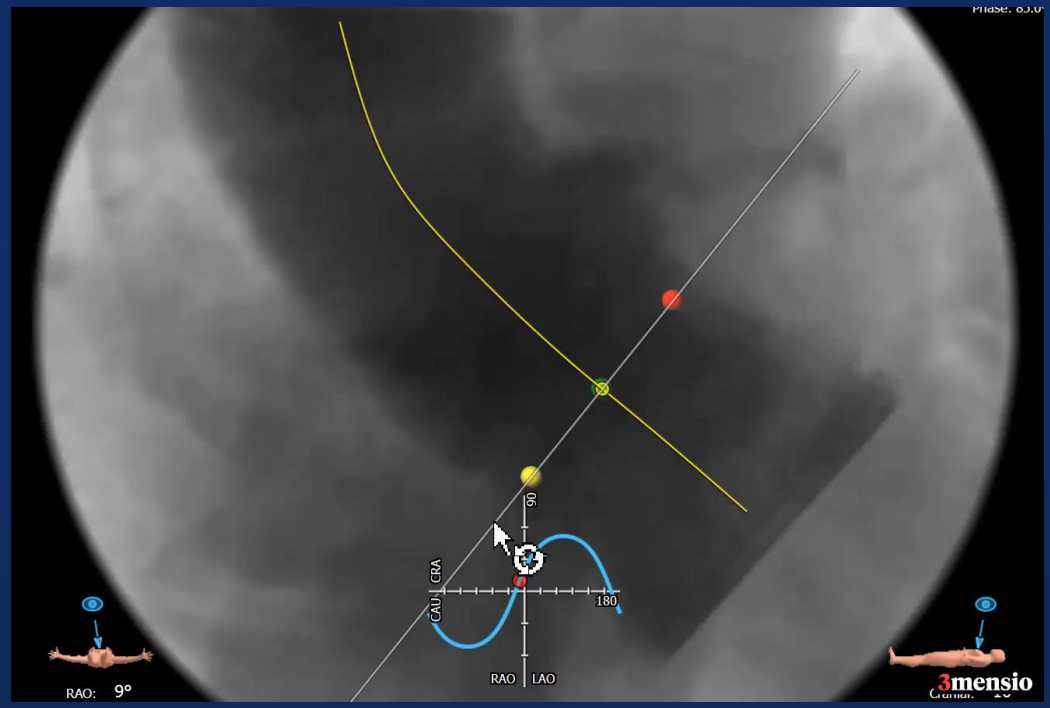


# Determine Cusp Overlap Imaging Projections

High quality CT imaging is critical to identify projections along the S-curve.



Rotation along the S-curve allows visualization of the basal annular plane in multiple projections.



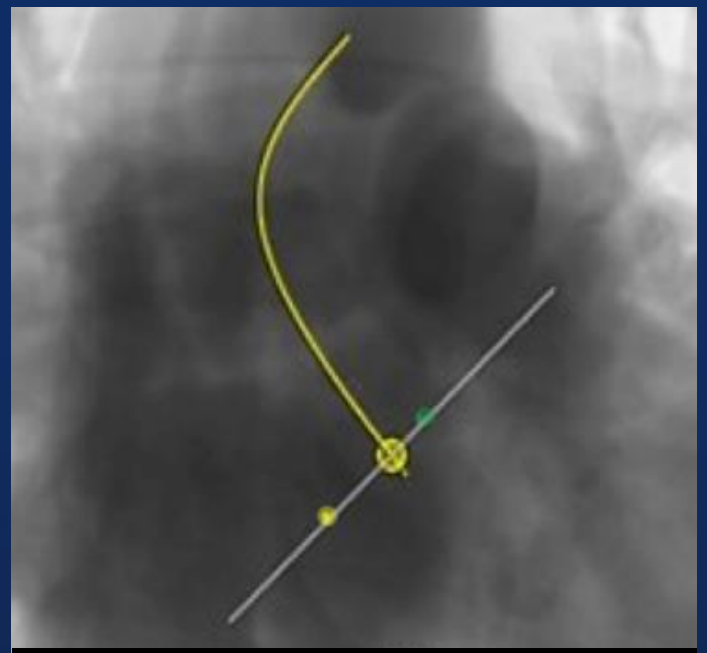
In a long axis view, determine cusp overlap projection by moving along S-curve until RCC and LCC overlap.

# Pre-Procedure CT Planning

## NEAR OVERLAP VIEW EXAMPLE

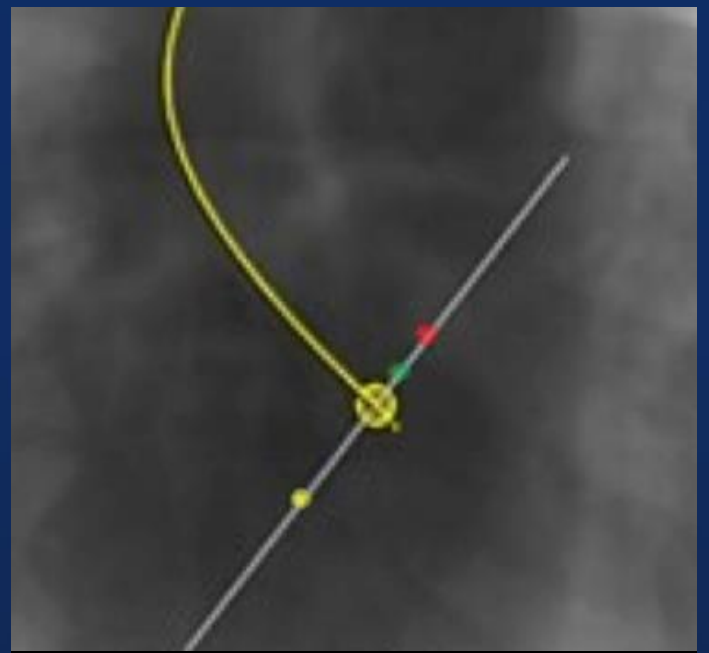
If the cusp overlap imaging projection is unattainable due to patient body habitus and/or equipment limitations, move along S-curve to a near cusp overlap view.

Overlap View



RAO 13˚, Caudal 42˚

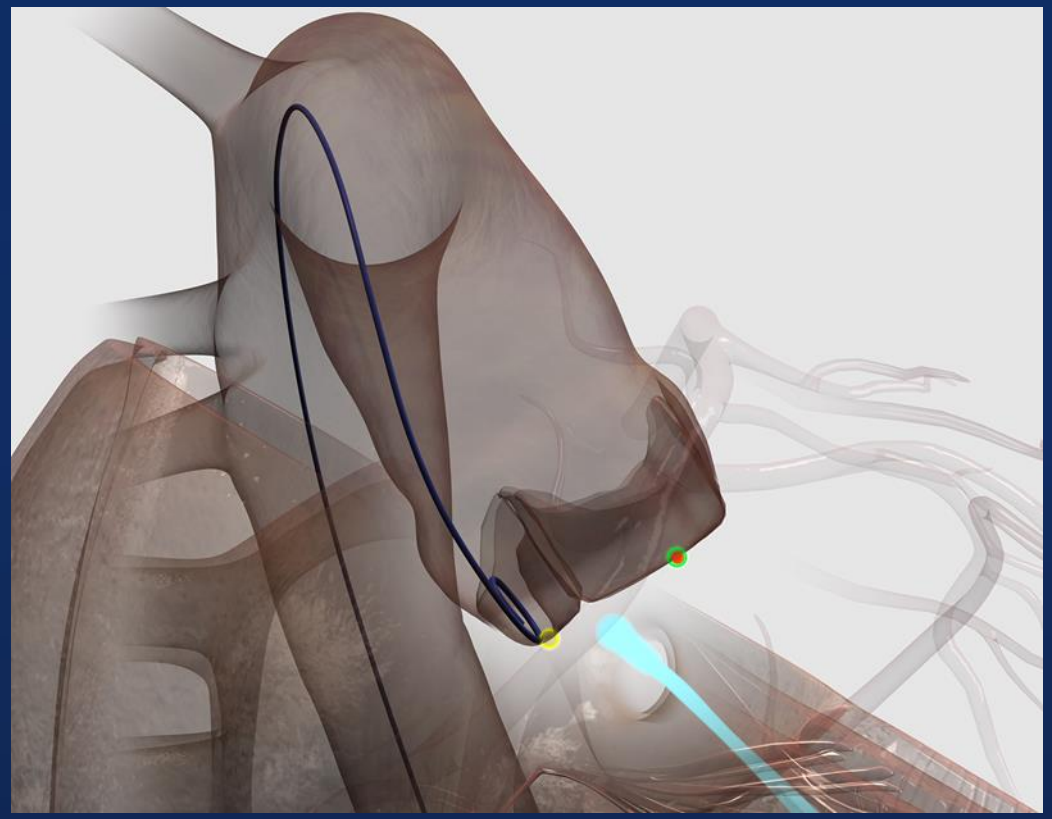
Near Overlap View



LAO 1˚, Caudal 30˚

# Assess Depth Accurately at the NCC

The L-R cusp overlap projection isolates the NCC, elongates visualization of the LVOT, and maintains coplanar cusp alignment to provide a more accurate view of TAV depth.



Views which do not maintain alignment of cusps introduce error in perception of TAV depth at the NCC and LCC[1]:

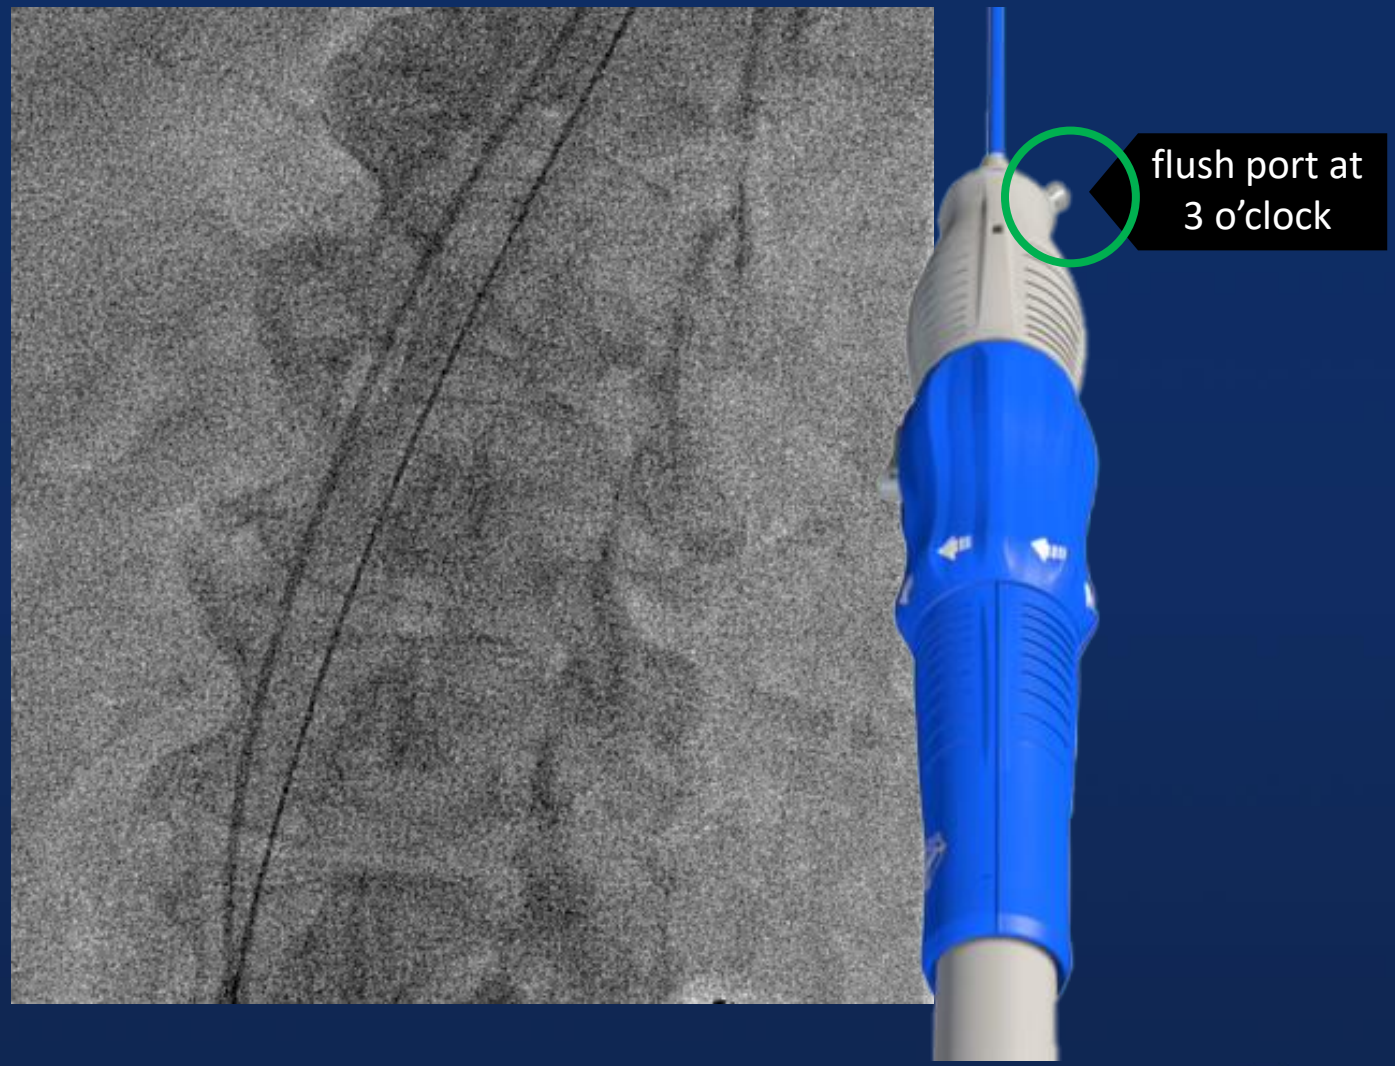
- This error results in TAV appearing higher than actual depth.
- An approximate error of 1 mm in depth is introduced for each 10° movement in the LAO or Caudal directions.

1. Fraser, D. Presented at London Valves, 2019.

# Introduce Delivery System

With the InLine Sheath fully forward and the flush port facing away from the operator (oriented at 3 o'clock), load the DCS onto the guidewire and insert into the patient.

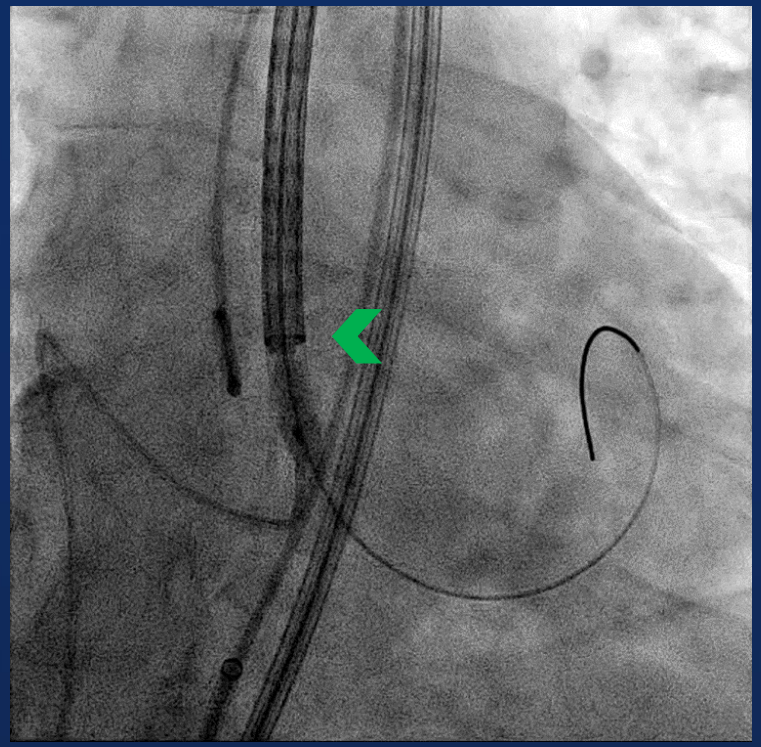
- 3 o'clock flush port orientation is reported to be associated with higher rates of commissural alignment between the TAV and native anatomy.[1]
- Commissural alignment may help facilitate future coronary access.



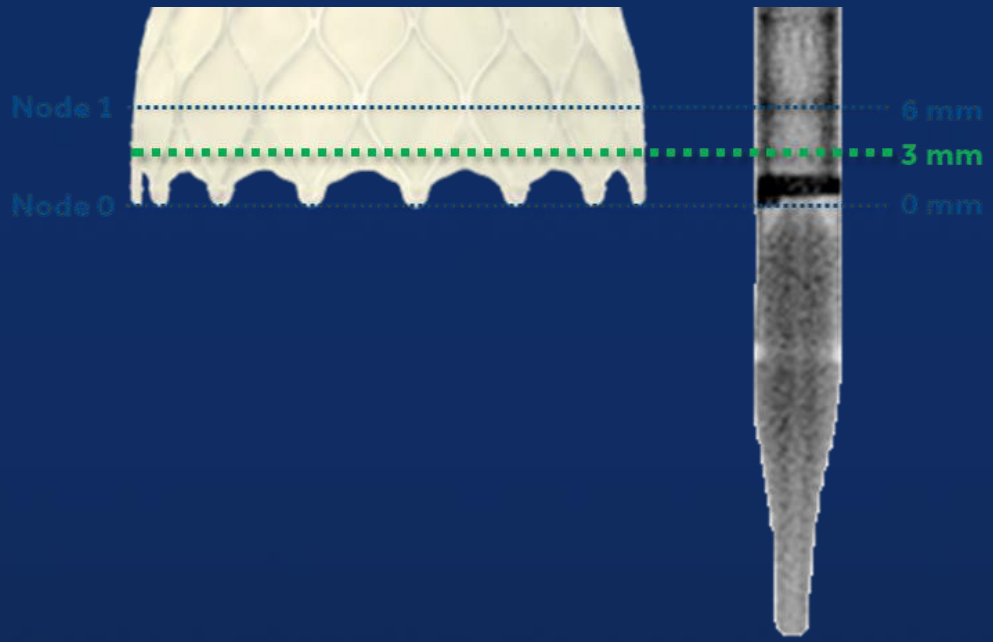
1. Tang et al. JACC: Cardiovascular Interventions, 2020.

# Reduce Interaction with Conduction System

More accurate visualization of depth and approaching target depth (3 mm) from above the annulus may reduce potential for conduction disturbances.



Begin Deployment with Radiopaque Marker Band at Mid-Pigtail



3 mm Target Implant Depth

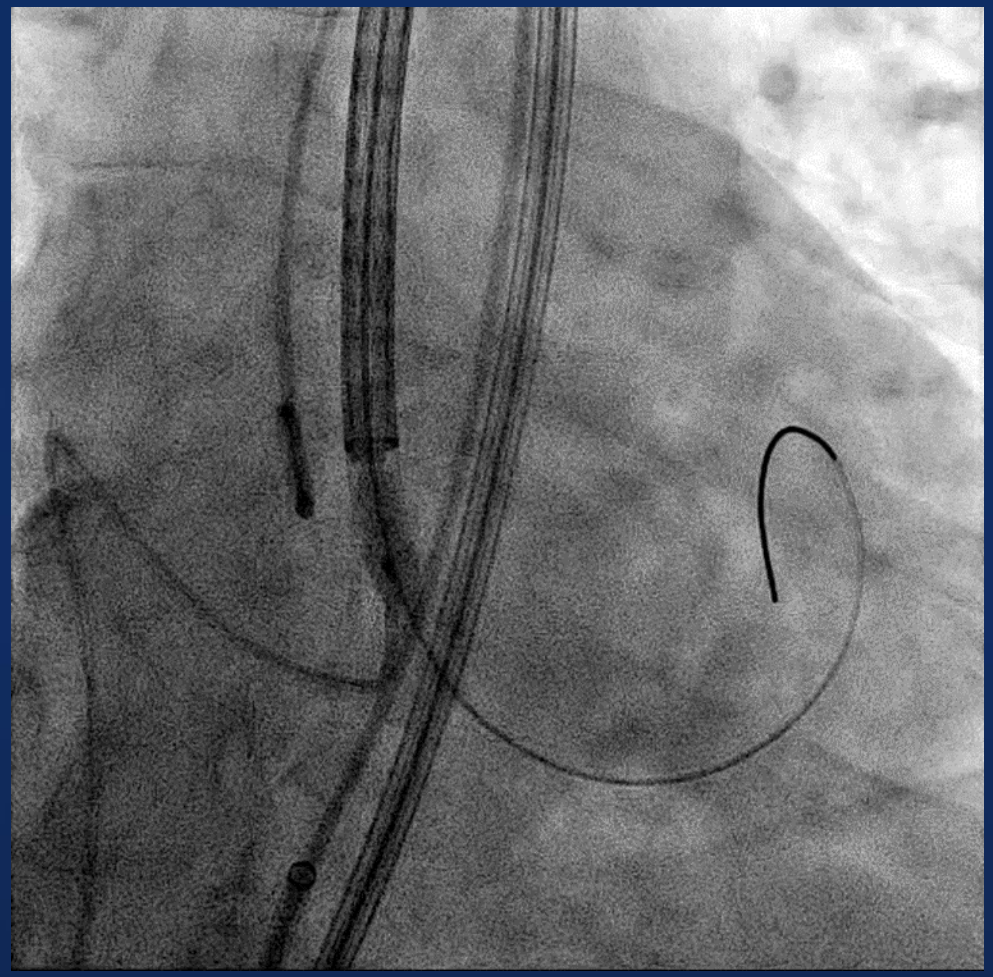
# Starting Position

## CUSP OVERLAP VIEW

After crossing the arch according to transfemoral best practices, move to the predetermined cusp overlap view.

Confirm placement of pigtail catheter at the bottom of the NCC and position the catheter marker band at the midpoint of pigtail catheter.

- If extreme parallax in catheter marker band is present, consider the following:
  - Adjust to a near overlap view
  - Reposition wire to ensure appropriate placement in non-right commissure
  - Select a more supportive wire

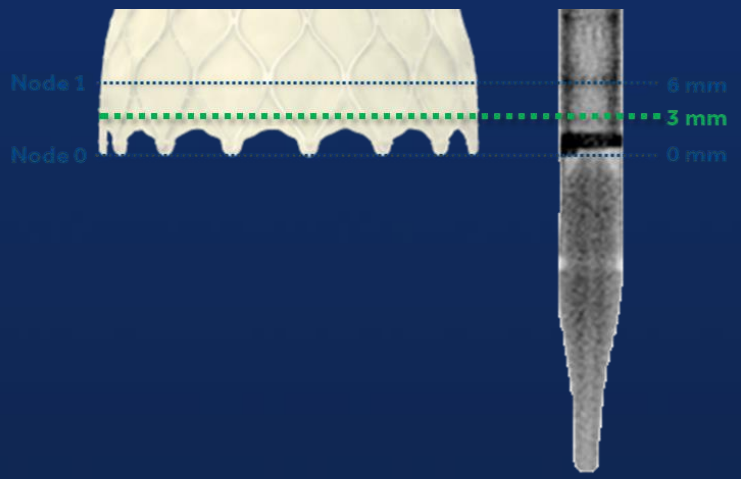


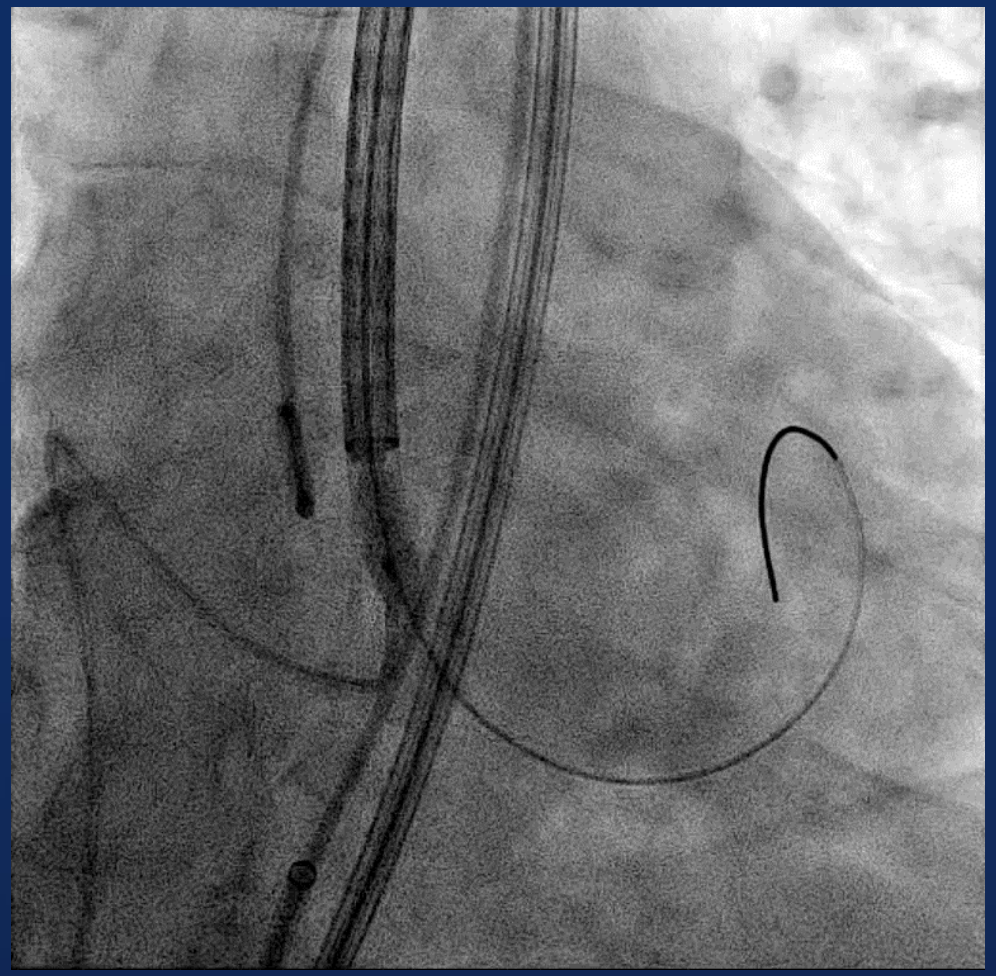
# Initial Deployment

## ADJUSTMENT TO TARGET IMPLANT DEPTH

**Slowly deploy the valve until the marker band reaches the third node of frame.**

- Use small movements (¼ turns) to facilitate slow deployment
- Approach target depth (3 mm) from a supra-annular starting position to allow valve to descend to target depth
  - This method is intended to minimize interaction below annulus to reduce risk of conduction abnormality





# Pacing Considerations

- **Consider using pacing to help increase valve stability by:**
  - Stabilizing hemodynamics.
  - Minimizing potential for late movement due to ectopy or respiration.

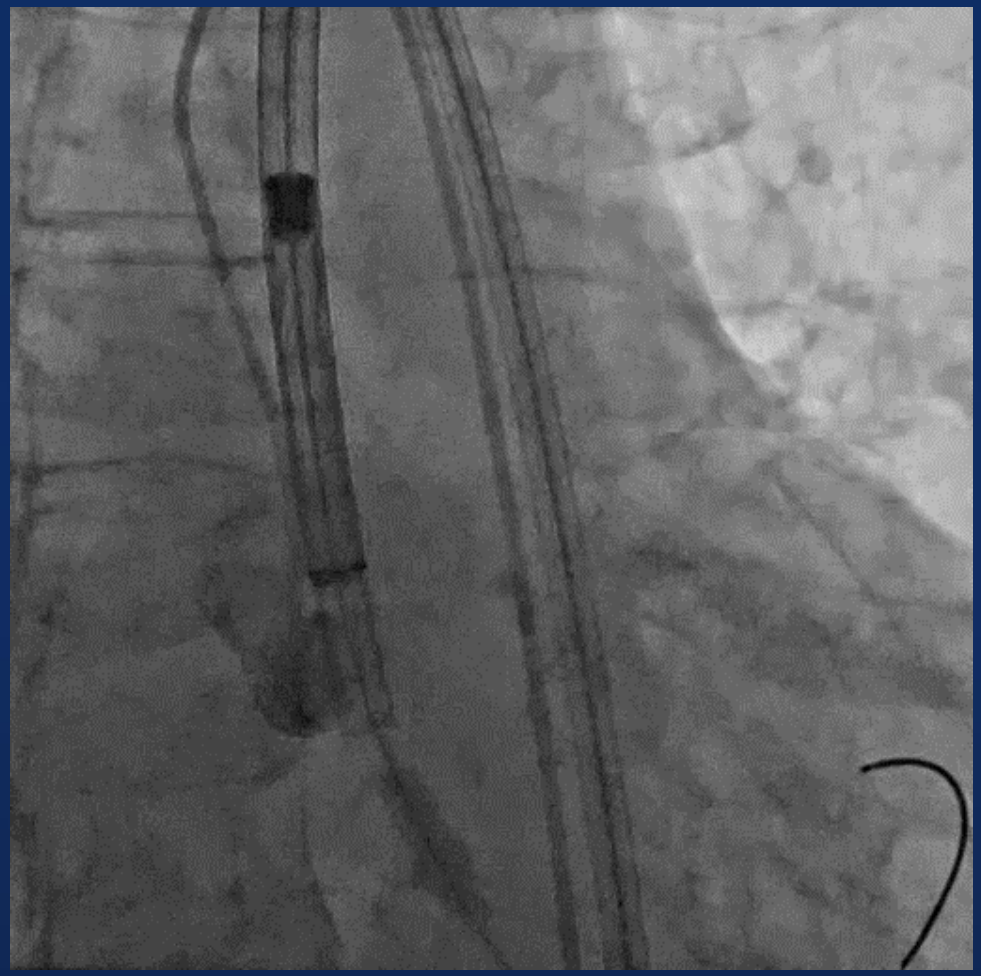
- **Steps**:

- Begin pacing  when marker band is at 3rd node (prior to annular contact).

- Start pacing at 120 bpm and adjust, in consideration of individual patient factors, to achieve desired systolic pressure.

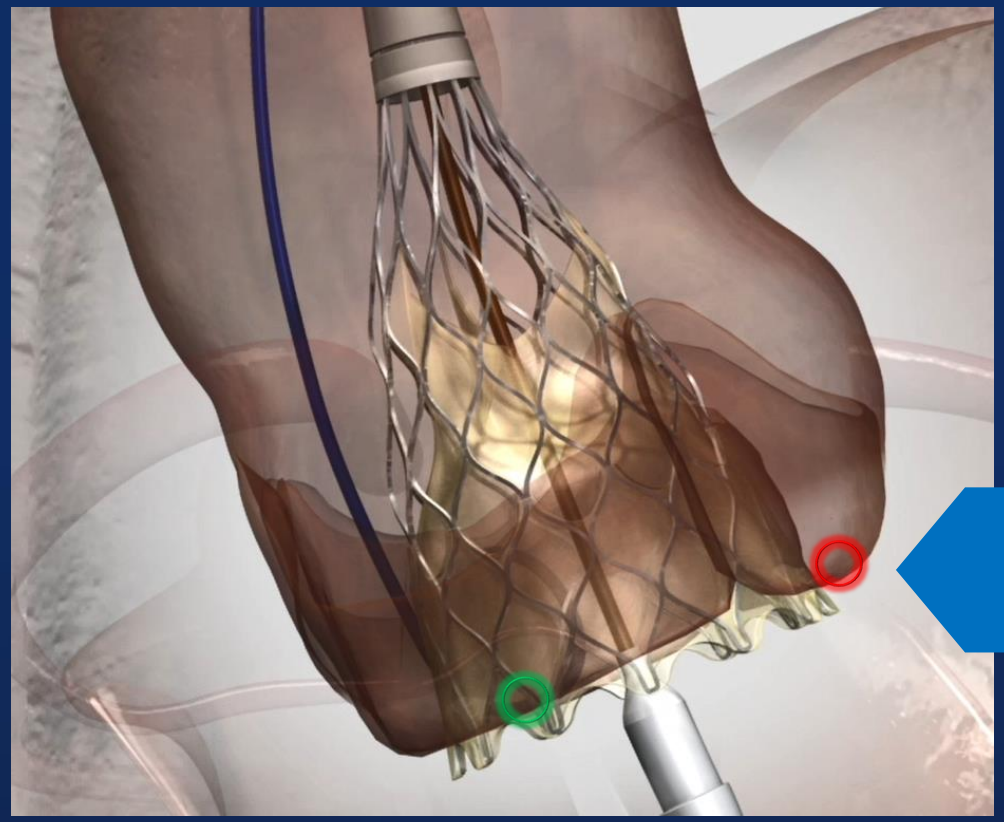
- Rapidly deploy from annular contact to before the point of no recapture as unexpanded bioprosthesis temporarily obstructs cardiac output.

- Discontinue pacing immediately before reaching the point of no recapture.
  - Consider discontinuation of pacing by stepping the rate down incrementally.



# Trust the Cusp Overlap View for NCC and Verify LCC Depth in the LAO View

Moving to an LAO view before the point of no recapture allows separation of the LCC to confirm depth and inform the decision to deploy or recapture the TAV.



Confirm TAV depth at LCC in the LAO view

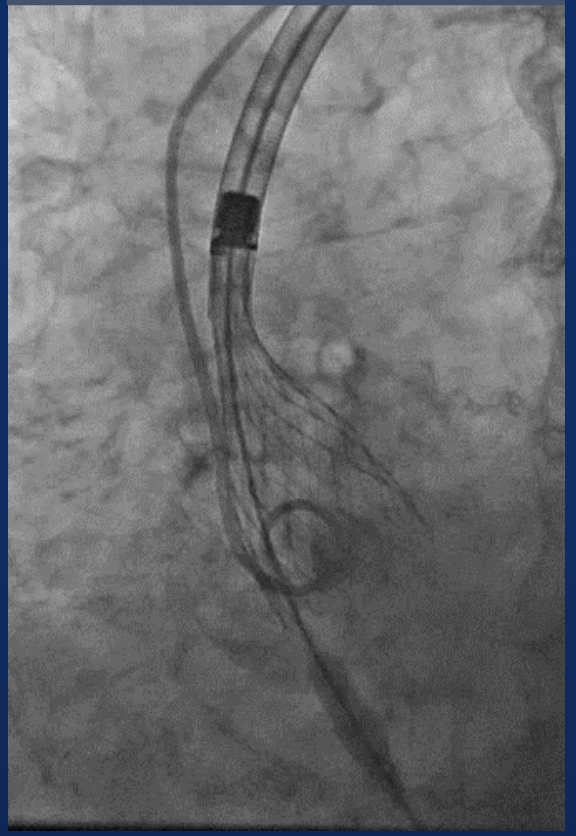
# Move to LAO View

## CONFIRM DEPTH AND PERFORMANCE

- **Move to a 3 cusp coplanar view and then roll LAO (no greater than 25˚) until aortic arch is open and parallax at the inflow is minimized.**
  - Remove any remaining parallax at inflow by moving caudal
- Assess depth at LCC
- Confirm valve performance:
  - Assess hemodynamics and prosthetic regurgitation
  - Confirm coronary perfusion
  - Determine whether to deploy or recapture

Cusp Overlap View

LAO View



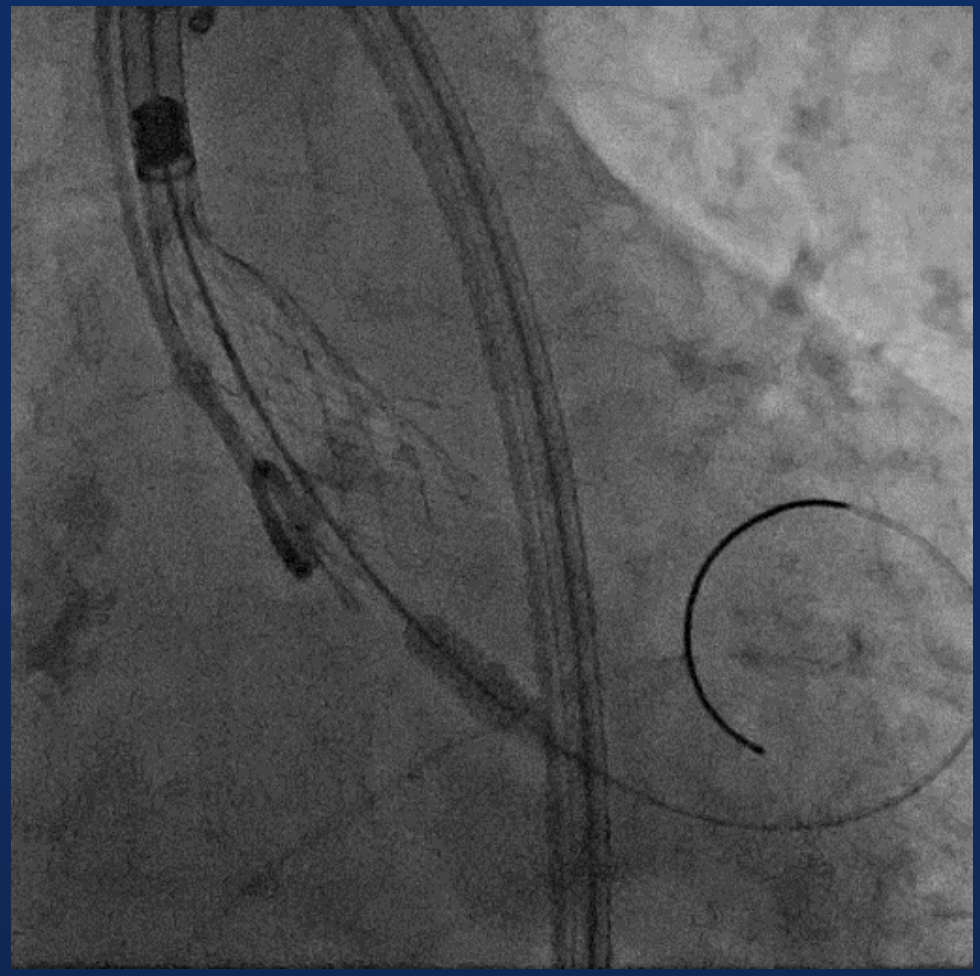
# Recapture Considerations

Just before the point of no recapture, assess valve position and depth; consider recapturing the TAV if depth is < 1 mm or > 5 mm at the NCC.

- Depth < 1 mm may contribute to an increased risk of valve migration upon release.
- Depth > 5 mm may contribute to an increased risk of conduction disturbances which may require a permanent pacemaker.

The valve can be partially or fully recaptured up to three times at any point before the point of no recapture:

- First two attempts to reposition and redeploy the valve.
- Third attempt must be a complete recapture and retrieval from patient.



Note: the valve will occlude cardiac output between 2/3 to 1/3 recapture.

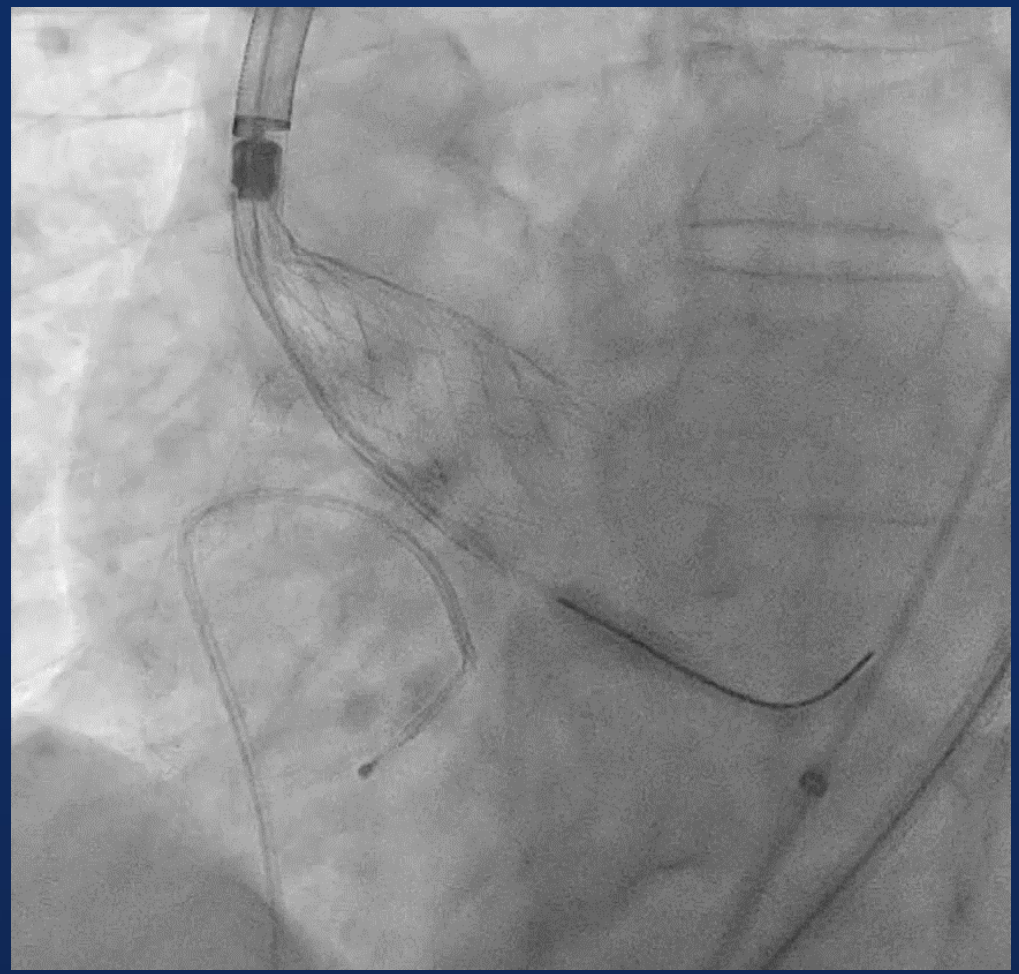
# Deployment

## PREPARING FOR FULL RELEASE

- After confirming valve position and performance, release tension, apply forward pressure to centralize delivery system in aorta,  and pull guidewire back from apex.

- Remove pigtail from NCC.

- Very slowly deploy as outflow region leaves capsule and paddles release.
  - Use ¼ turns and pauses to minimize any potential movement upon release.
  - This final phase of deployment should generally be completed over 30 seconds.



# CoreValve

## Self-Expanding Frame

- Conforms and seals to the annulus
- The foundation for recapturability

## Supra Annular Valve Design

- Maximize flow and optimize coaptation

## Porcine Pericardial Tissue

- Thinness for low profile delivery
- Strength and pliability for long-term durability

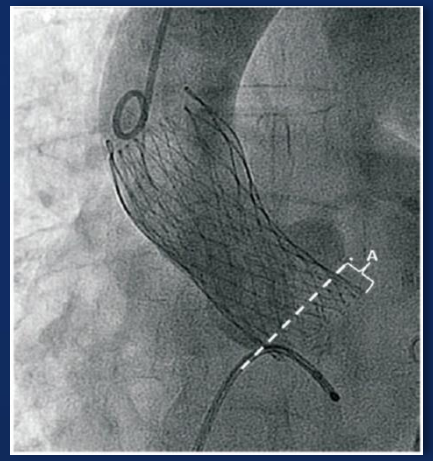
# Design Goals For Evolut R



(TcheTche, et. al. – EuroIntervention 2012)

1. **Low Sheath OD to Femoral Artery Ratio (SFAR)**
   Reduces risk of major vascular complications and improves access

2. **Positioning Accuracy** Key to achieving superior clinical outcomes, including PVL performance and conduction disturbances

3. **Annular sealing**
   Reduces paravalvular leak

4. **Ease-of-use**

**Table 2.** Primary and Secondary Outcomes at 1 Year (Intention-to-Treat Population).*

| Outcome | TAVI (N=701) | | SAVR (N=713) | | Hazard Ratio (95% CI) |
|---|---|---|---|---|---|
| | *no. of events* | *% of patients* | *no. of events* | *% of patients* | |
| **Primary outcome** | | | | | |
| Death from any cause or stroke† | 37 | 5.4 | 68 | 10.0 | 0.53 (0.35–0.79) |
| **Secondary outcomes** | | | | | |
| Death from any cause | 18 | 2.6 | 42 | 6.2 | 0.43 (0.24–0.73) |
| Stroke | 20 | 2.9 | 32 | 4.7 | 0.61 (0.35–1.06) |
| Stroke or TIA | 28 | 4.1 | 35 | 5.1 | 0.78 (0.47–1.27) |
| Disabling stroke | 9 | 1.3 | 21 | 3.1 | 0.42 (0.19–0.88) |
| Death from any cause or disabling stroke | 26 | 3.8 | 57 | 8.4 | 0.45 (0.28–0.70) |
| Cardiovascular death | 14 | 2.0 | 30 | 4.4 | 0.47 (0.24–0.86) |
| Myocardial infarction | 7 | 1.0 | 14 | 2.1 | 0.51 (0.20–1.19) |
| New-onset atrial fibrillation | 86 | 12.4 | 211 | 30.8 | 0.36 (0.28–0.46) |
| New-onset left bundle-branch block | 222 | 32.0 | 120 | 17.5 | 2.03 (1.63–2.54) |
| New permanent pacemaker implantation | 82 | 11.8 | 47 | 6.7 | 1.81 (1.27–2.61) |
| Prosthetic-valve dysfunction | 11 | 1.6 | 4 | 0.6 | 2.44 (0.87–8.15) |
| Prosthetic-valve endocarditis | 4 | 0.6 | 7 | 0.9 | 0.66 (0.18–2.19) |
| Prosthetic-valve thrombosis | 5 | 0.7 | 2 | 0.3 | 2.09 (0.50–11.64) |
| Aortic-valve reintervention | 4 | 0.6 | 2 | 0.3 | 1.70 (0.38–9.78) |
| Major or life-threatening or disabling bleeding | 30 | 4.3 | 119 | 17.2 | 0.24 (0.16–0.35) |
| Acute kidney injury of stage II or III‡ | 9 | 1.3 | 17 | 2.5 | 0.56 (0.24–1.21) |
| Vascular access-site complication | 55 | 7.9 | 5 | 0.7 | 10.64 (4.84–28.94) |
| Rehospitalization for cardiovascular cause | 84 | 12.2 | 91 | 13.3 | 0.89 (0.66–1.20) |

* The analyses were stratified according to the STS-PROM score. The percentage of patients was calculated as a Kaplan–Meier estimate. The 95% confidence intervals have not been adjusted for multiplicity and should not be used to make hypothesis-test inferences about superiority or noninferiority. TIA denotes transient ischemic attack.
† P<0.001 for the primary analysis.
‡ Acute kidney injury was adjudicated according to Valve Academic Research Consortium 2 criteria within 7 days after the index procedure.

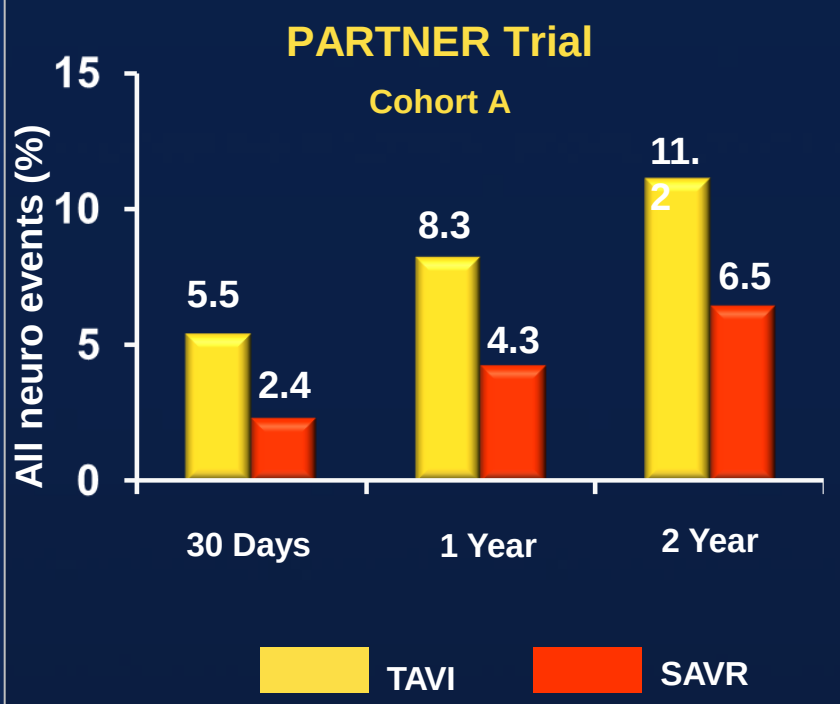
# Complications

# Stroke

## Causes

- **Mechanical Dislodgement**
  - Catheters, Delivery system,
  - Balloon valvuloplasty, Valve depolyment
- **Thrombus Formation**
  - Inadequate anticoagulation/antiplatelet Tx
  - Stasis/Thrombus on device,
  - Apical thrombus
- **Patient Factors**
  - Age, LV dysfunction, Atrial fibrillation,
  - Pre-existing cerebrovascular disease,
  - Presence of aortic debris
- **Others**
  - Bleeding, Low output status, Air emboli

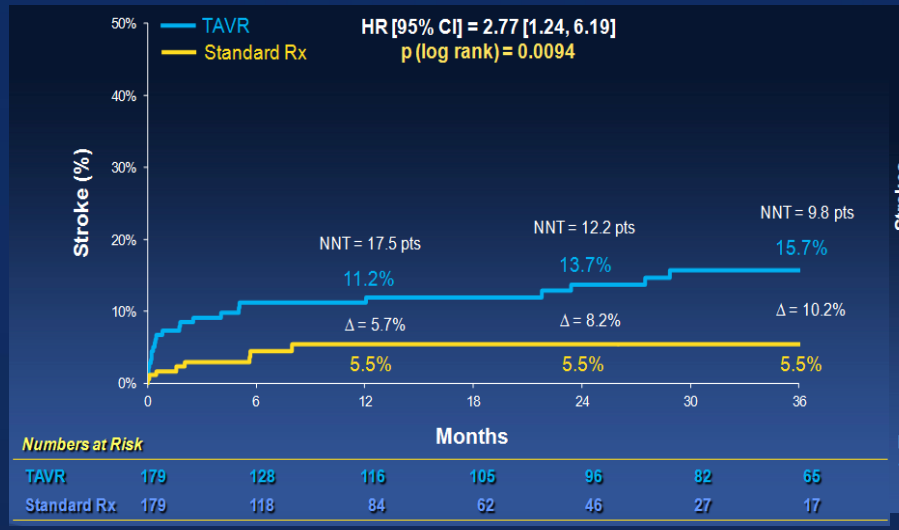
## Incidence of Stroke



# PARTNER trial : All Stroke (ITT)

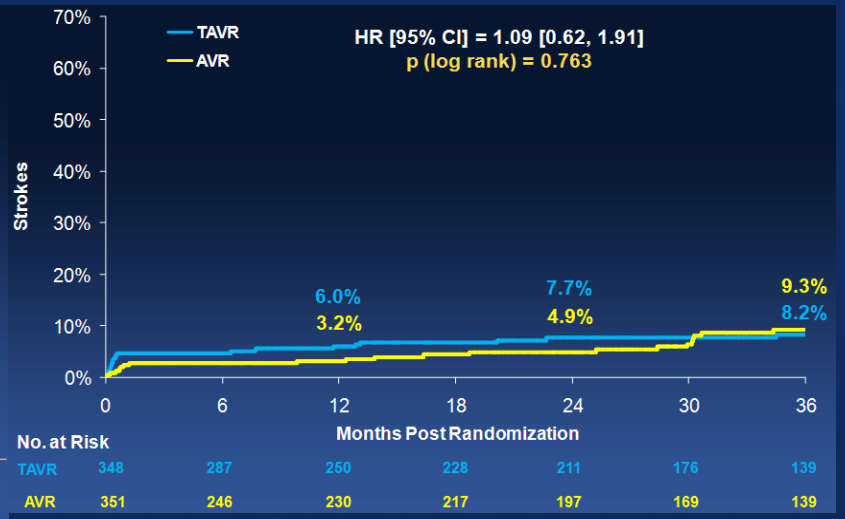
## 3 year follow-up

### Inoperable Cohort



Samir R. Kapadia et al. TCT 2012

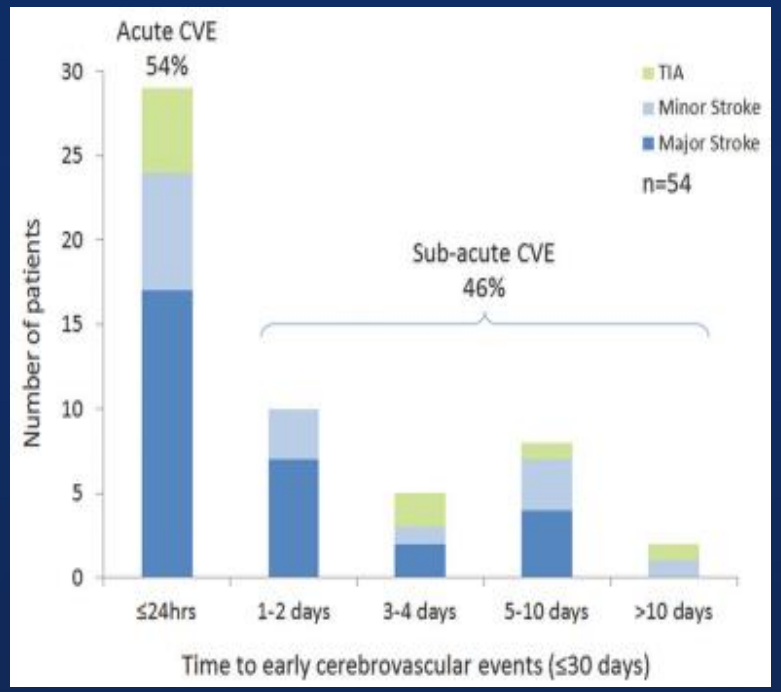
### High Risk Cohort



Vinod H. Thourani et al. ACC 2013

# Timing, Predictive Factors, and Prognostic Value of Stroke in TAVI

**Observational study looked at stroke/TIA in 1,061 patients treated at 5 centers, January 2005-September 2011.**

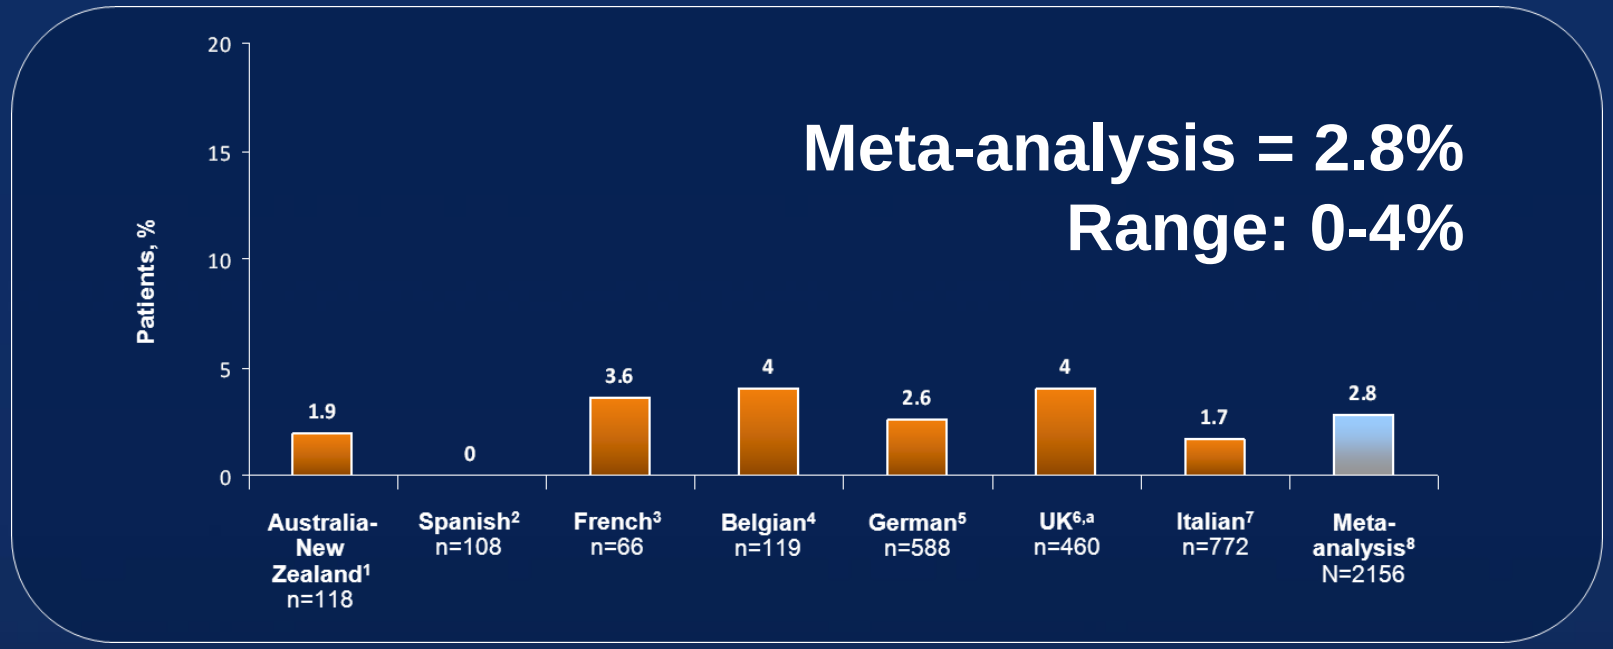


- Acute events (≤24 hrs) independently predicted by balloon postdilation and valve dislodgement/ embolization
- Subacute events (1-30 days) predicted by new onset A-fib, while late events (> 30 days) associated with chronic A-fib, PVD, and cerebrovascular disease
- Major stroke predicts mortality both early (OR 7.43; 95% CI 2.45-22.53) and late (HR 1.75; 95% CI 1.01-3.04)

**Luis Nombela-Franco, et al. Circulation. 2012;126:3041-3053.**

# CoreValve Meta-analysis

## 30 day stroke rate



Stroke is not defined consistently across all studies.
[a]In-hospital stroke rate reported.

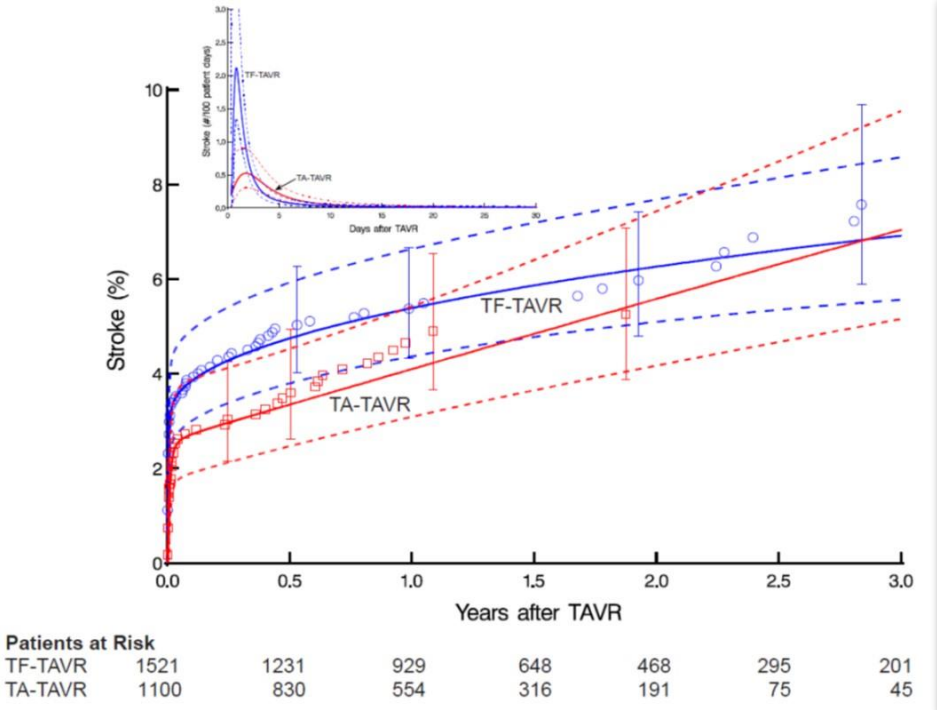
# Timing, Risk Factors, Outcomes of Stroke, TIA after TAVR: PARTNER Trial

2621 participants in the PARTNER trial and continued-access registry who were followed out to 30 days, 1 year, and 3 years.



- **Stroke incidence was 3.3% at 30d (of which 85% occurred within 1week)**
- **Rates were 3.8% at 30d, 5.4% at 1y, and 6.9% at 3y for TF-TAVR**
- **Higher pre-TAVR AV peak gradient was key risk factor for stroke following TF TAVR; more postdilations, pure aortic stenosis without regurgitation, more pacing runs, earlier date of procedure, and lack of DAPT were risk factors for stroke following TA TAVR**

Kapadia S, et al. Circ Cardiovasc Interv. 2016;9:e002981.

# Transcatheter Aortic Valve Replacement and Stroke: a comprehensive review

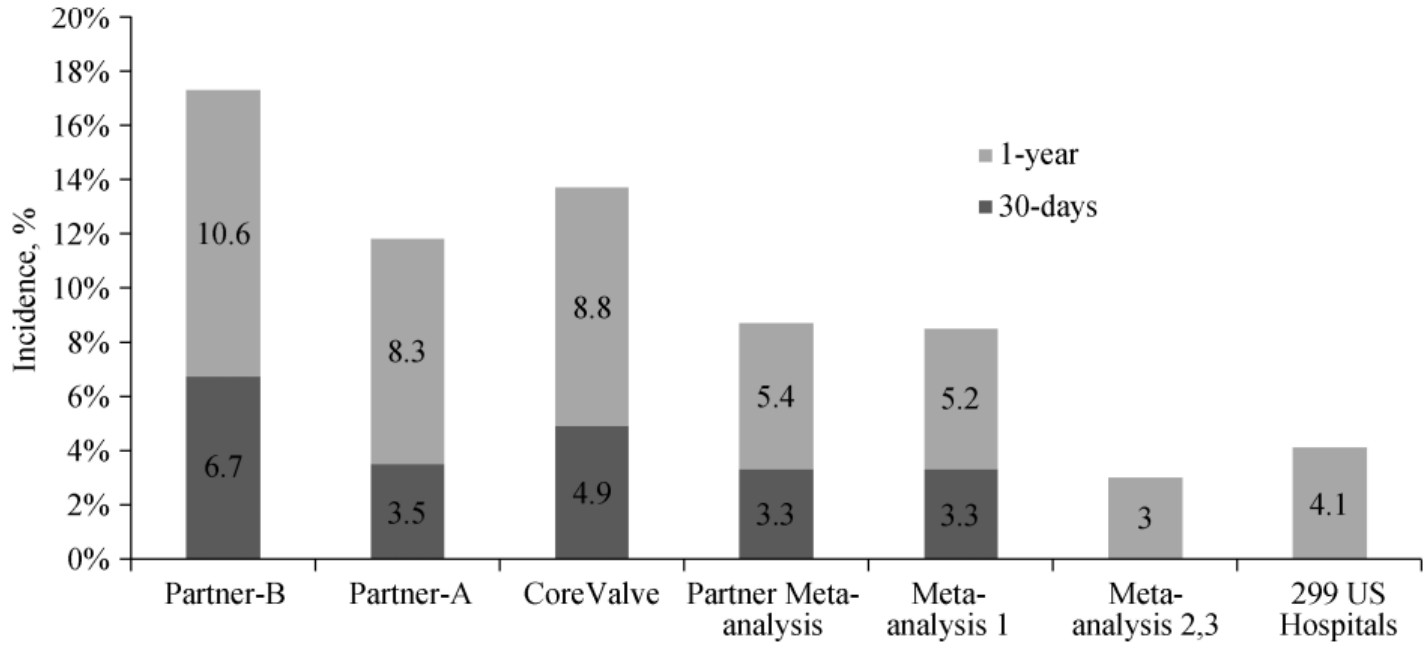


**Figure 1. Incidence of stroke following TAVR in landmark studies and meta-analyses.** PARTNER-B,[4] PARTNER-A,[12] CoreValve,[7] PARTNER Meta-analysis,[11] meta-analysis 1,[15] meta-analyses 2,3,[9,23] and 299 US hospitals.[24] TAVR: transcatheter aortic valve replacement.

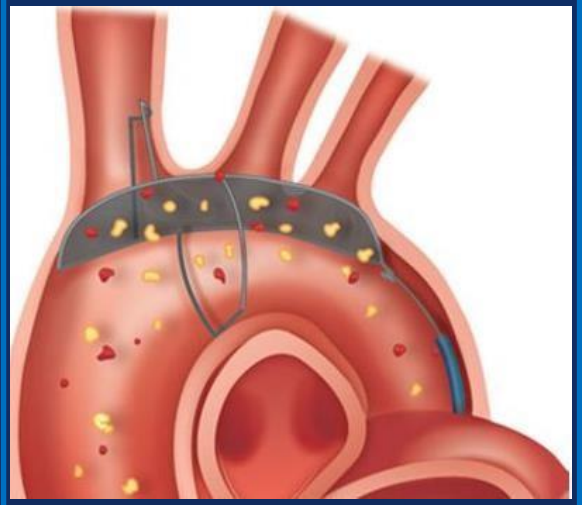
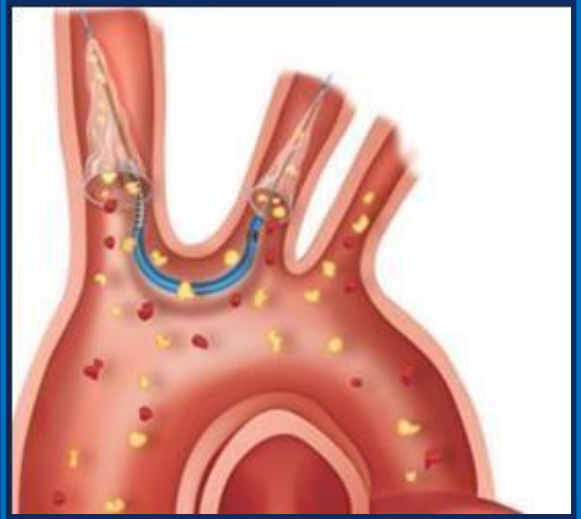
# Embolic protection devices

## TriGuard Embolic Deflection Device (Keystone Heart)[1]



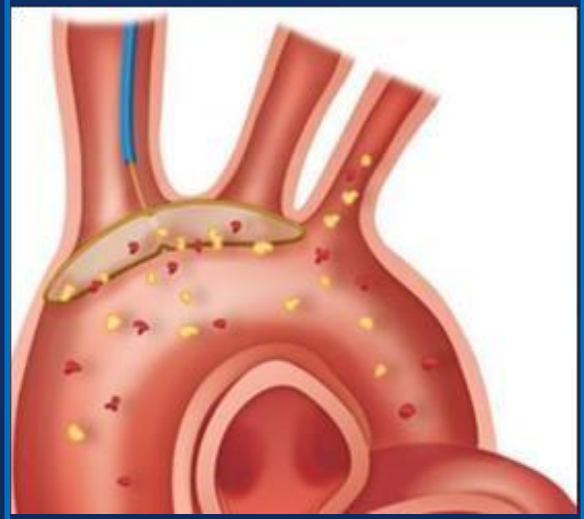
- ✓ Pore Size: 130 µm
- ✓ Delivery Sheath: 9F
- ✓ Access: Transfemoral
- ✓ Coverage: Brachiocephalic, left common carotid, left subclavian

## Sentinel Cerebral Protection System (Claret Medical)[2]



- ✓ Pore Size: 140 µm
- ✓ Delivery Sheath: 6F
- ✓ Access: Brachial or radial
- ✓ Coverage: Brachiocephalic, left common carotid

## Embrella Embolic Deflector System (Edwards Lifesciences)[3]



- ✓ Pore Size: 100 µm
- ✓ Delivery Sheath: 6F
- ✓ Access: Brachial
- ✓ Coverage: Brachiocephalic, left common carotid

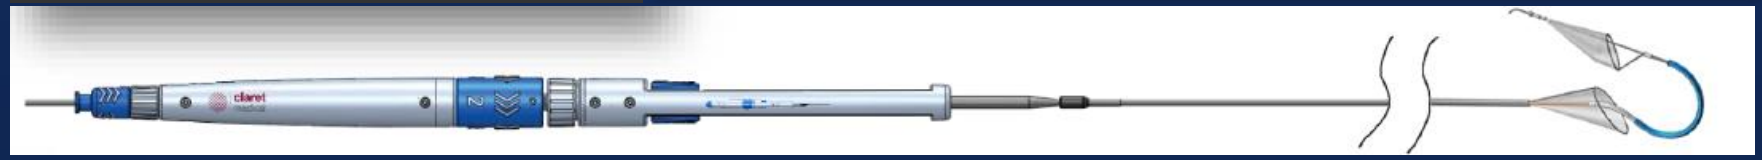
# Claret Sentinel™ Cerebral Protection System (CPS)

- The only dual, independent filter (proximal and distal) cerebral embolic protection device with visible embolic debris capture and removal
- The 3rd generation of the 1st commercially available CE-marked embolic protection device
- Universal size and shape
- Deflectable compound curve sheath facilitates cannulation of LCC
- Right transradial6F sheath access using a standard 0.014” guidewire
- Filters are out of the way of TAVI delivery catheter and accessories during the TAVI procedure



Susheel Kodali, TCT 2015

# Examples of debris captured with Claret CPS

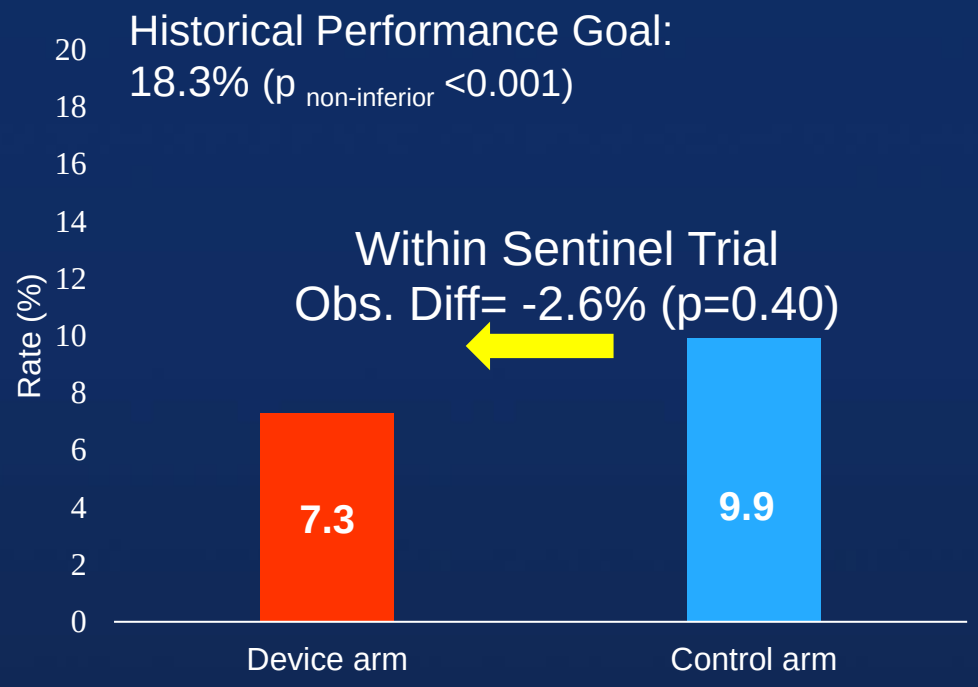
# SENTINEL Trial

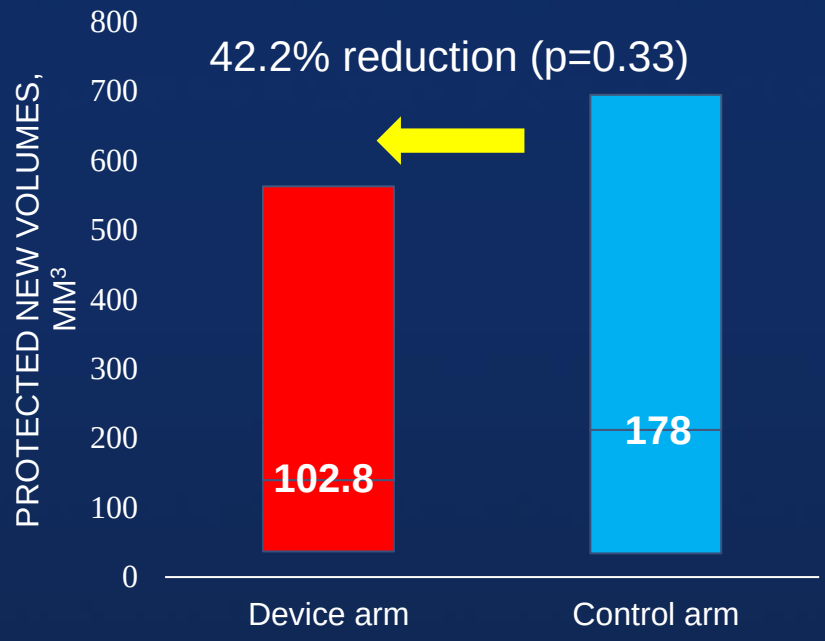
## Primary Safety Endpoint

*30-Day MACCE*



## Primary Efficacy Endpoint

*MRI New Lesion Volume (Protected Territories)*



**Kapadia SR, et al. J Am Coll Cardiol. 2017;69:367–377.**

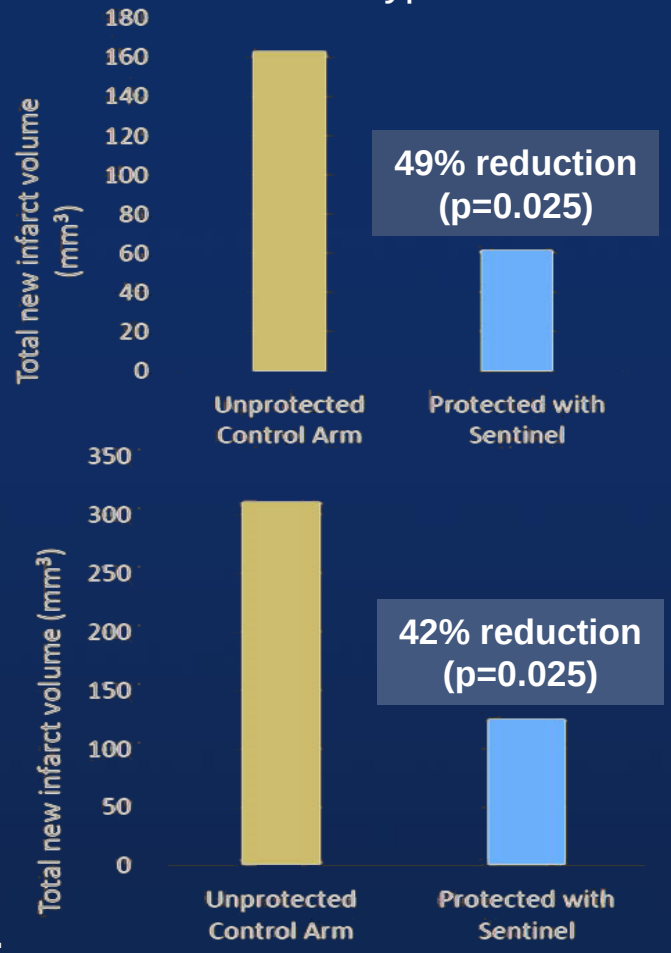
# SENTINEL Trial

## New Lesion Volume – Protected and All Territories

Adjusted for Baseline lesion volume, Valve Type, Interaction of Valve Type and Treatment Arm

| | Mean Estimate (95% CI) | p-value |
|---|---|---|
| **Protected Territories** | | |
| Control Arm | 162.8 mm3 (107.9, 245.5) | 0.0248 |
| Sentinel Arm | 83.3 mm3 (55.0, 126.1) | |

| | Mean Estimate (95% CI) | p-value |
|---|---|---|
| **All Territories** | | |
| Control Arm | 311.1 mm3 (212.2, 456.3) | 0.0500 |
| Sentinel Arm | 180.6 mm3 (122.7, 265.8) | |



Kapadia SR, et al. J Am Coll Cardiol. 2017;69:367–377.

# Cerebral Embolic Protection and Outcomes of TAVR

Observational study from STS/ACC TVT Registry

**Table 2. Unadjusted Outcomes**

| | EPD usage (N=12 409) | No EPD usage (N=110 777) | Odds ratio (95% CI) | *P* value |
|---|---|---|---|---|
| Primary end point | | | | |
| In-hospital stroke, n/N (%) | 158/12 409 (1.3) | 1716/110 777 (1.5) | 0.82 (0.65–1.03) | 0.083 |
| Secondary end points | | | | |
| In-hospital stroke or death, n/N (%) | 245/12 409 (2.0) | 2876/110 777 (2.6) | 0.76 (0.62–0.92) | 0.006 |
| In-hospital stroke or TIA, n/N (%) | 183/12 409 (1.5) | 1872/110 777 (1.7) | 0.87 (0.72–1.06) | 0.160 |
| In-hospital death, n/N (%) | 99/12 409 (0.8) | 1317/110 777 (1.2) | 0.67 (0.51–0.88) | 0.005 |
| Device success, n/N (%) | 11 745/12 120 (96.9) | 107 072/110 090 (97.3) | 0.88 (0.62–1.25) | 0.482 |
| In-hospital major bleeding, n/N (%) | 491/12 266 (4.0) | 4808/108 858 (4.4) | 0.90 (0.75–1.09) | 0.277 |
| 30-day stroke, n/N (%) | 216/11 682 (1.8) | 2224/102 919 (2.2) | 0.85 (0.7–1.04) | 0.123 |
| 30-day death, n/N (%) | 162/11 658 (1.4) | 2297/102 877 (2.2) | 0.62 (0.49–0.78) | <0.001 |
| Falsification end point | | | | |
| GI/GU bleeding, n/N (%) | 58/12 409 (0.5) | 501/110 777 (0.5) | 1.03 (0.75–1.42) | 0.837 |

Odds ratios, 95% CIs, and Wald Chi-square *P* values obtained from unadjusted generalized estimating equations, accounting for with clustering by site. EPD indicates embolic protection device; GI/GU, gastrointestinal/genitourinary; and TIA, transient ischemic attack.

# Conduction Disturbance

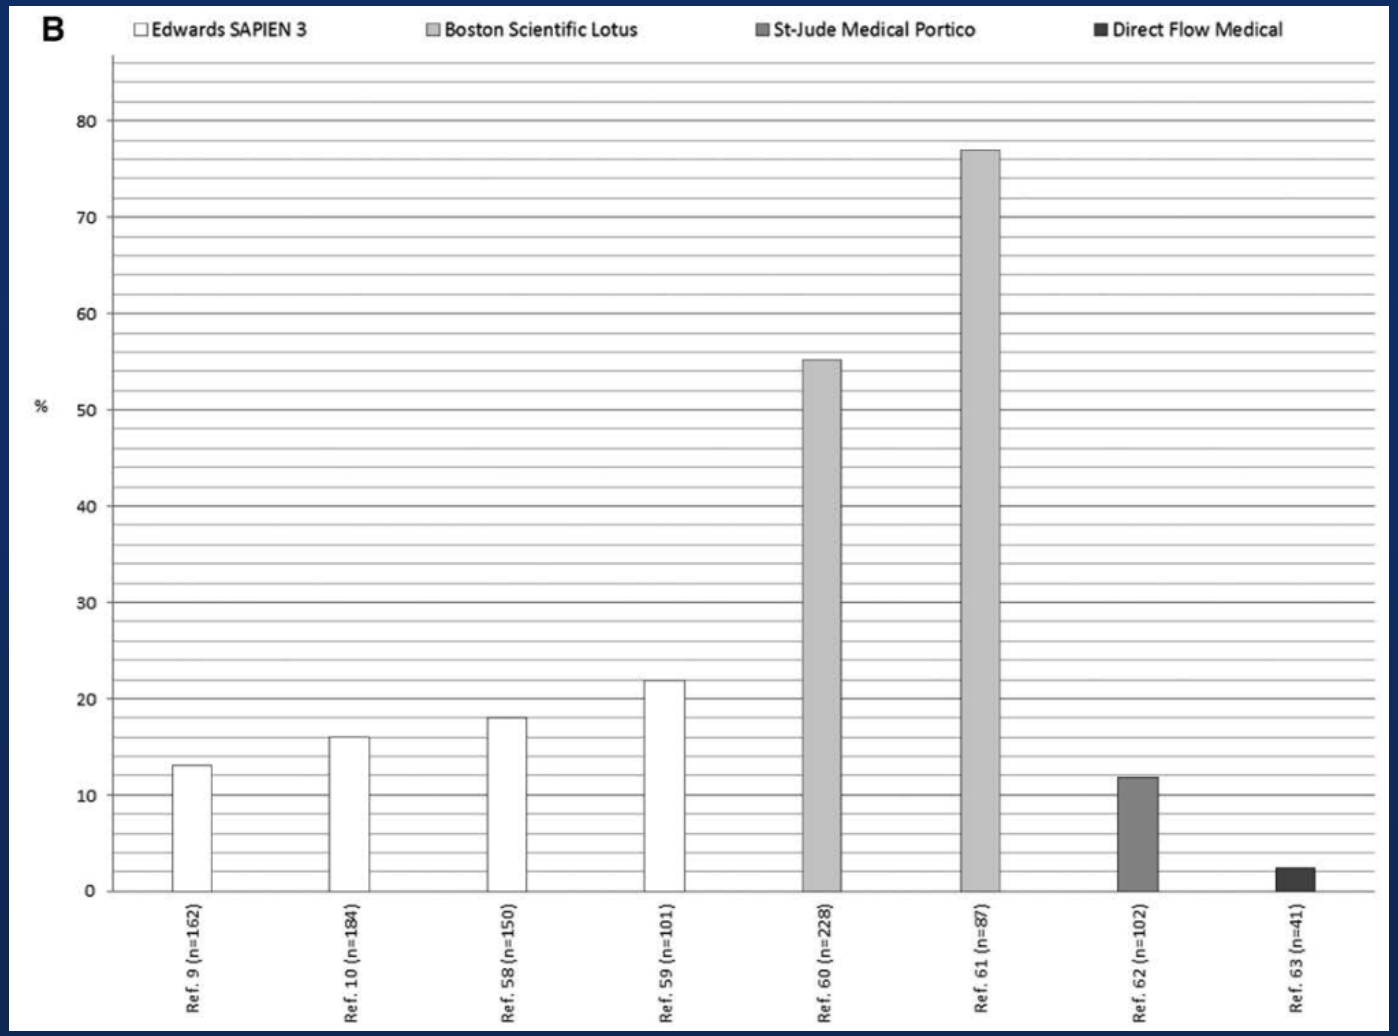
## Incidence of new-onset left bundle-branch block (LBBB)



Vincent Auffret et al, Circulation. 2017;136:1049–1069.

# Pacemakker Implantation After Balloon- or Self-Expandable TAVR

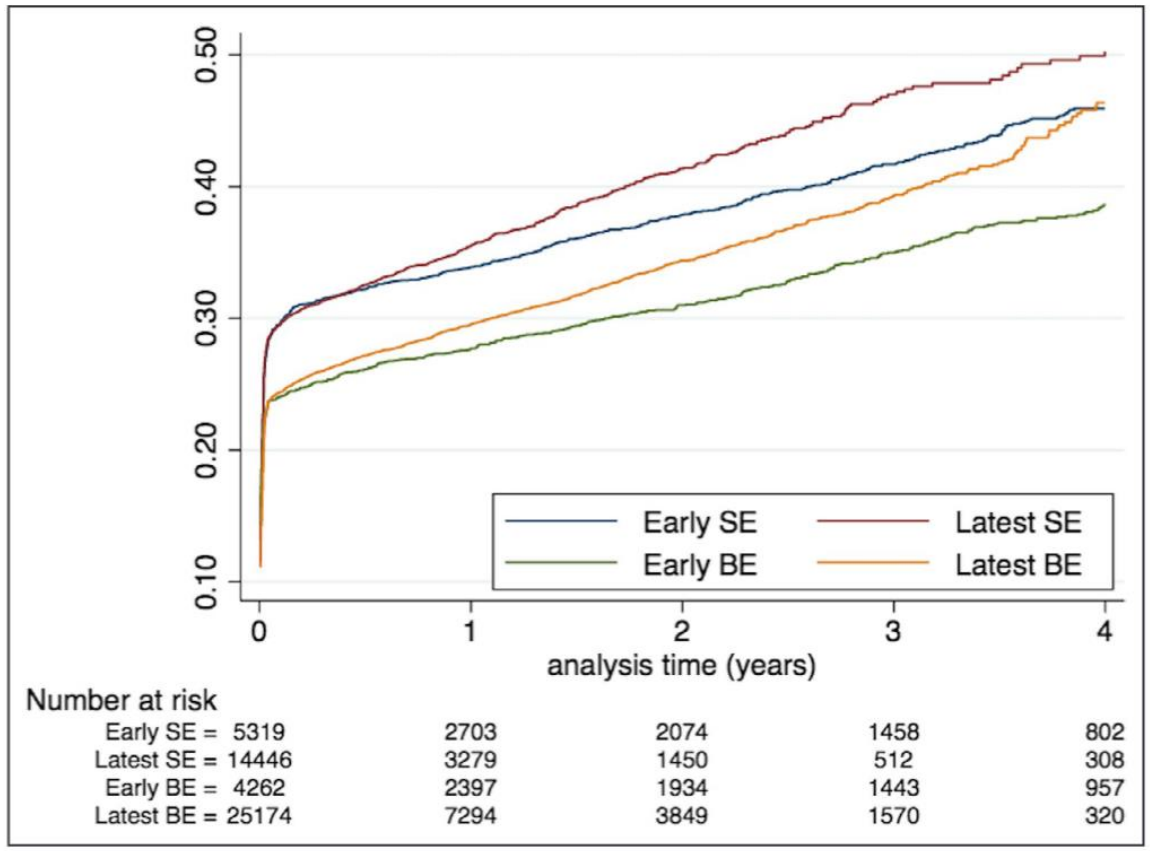


**Figure. Incidence of permanent pacemaker implantation in patients treated with TAVR, according to type and generation of device.**
BE indicates balloon-expandable; Early BE, Edwards Sapien XT; Early SE, Medtronic Corevalve; Latest BE, Edwards Sapien 3; Latest SE, Medtronic Evolut; SE, self-expandable; and TAVR, transcatheter aortic valve replacement.

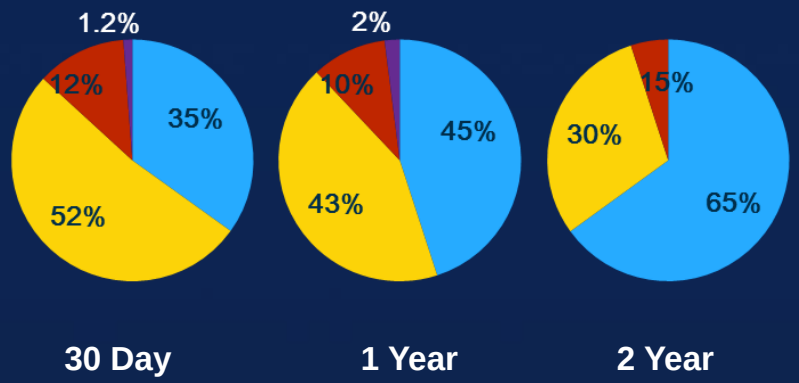
- BE technology was independently associated with lower incidence rates of PPI both at the acute and chronic phases than SE technology.
- Recent generations of TAVR were not independently associated with different rates of PPI than early generations during the overall follow-up.

Arnaud Bisson, et al. J Am Heart Assoc. 2020;9:e015896.

# Para-valvular Leak

## Incidence of AR

**PARTNER Trial**



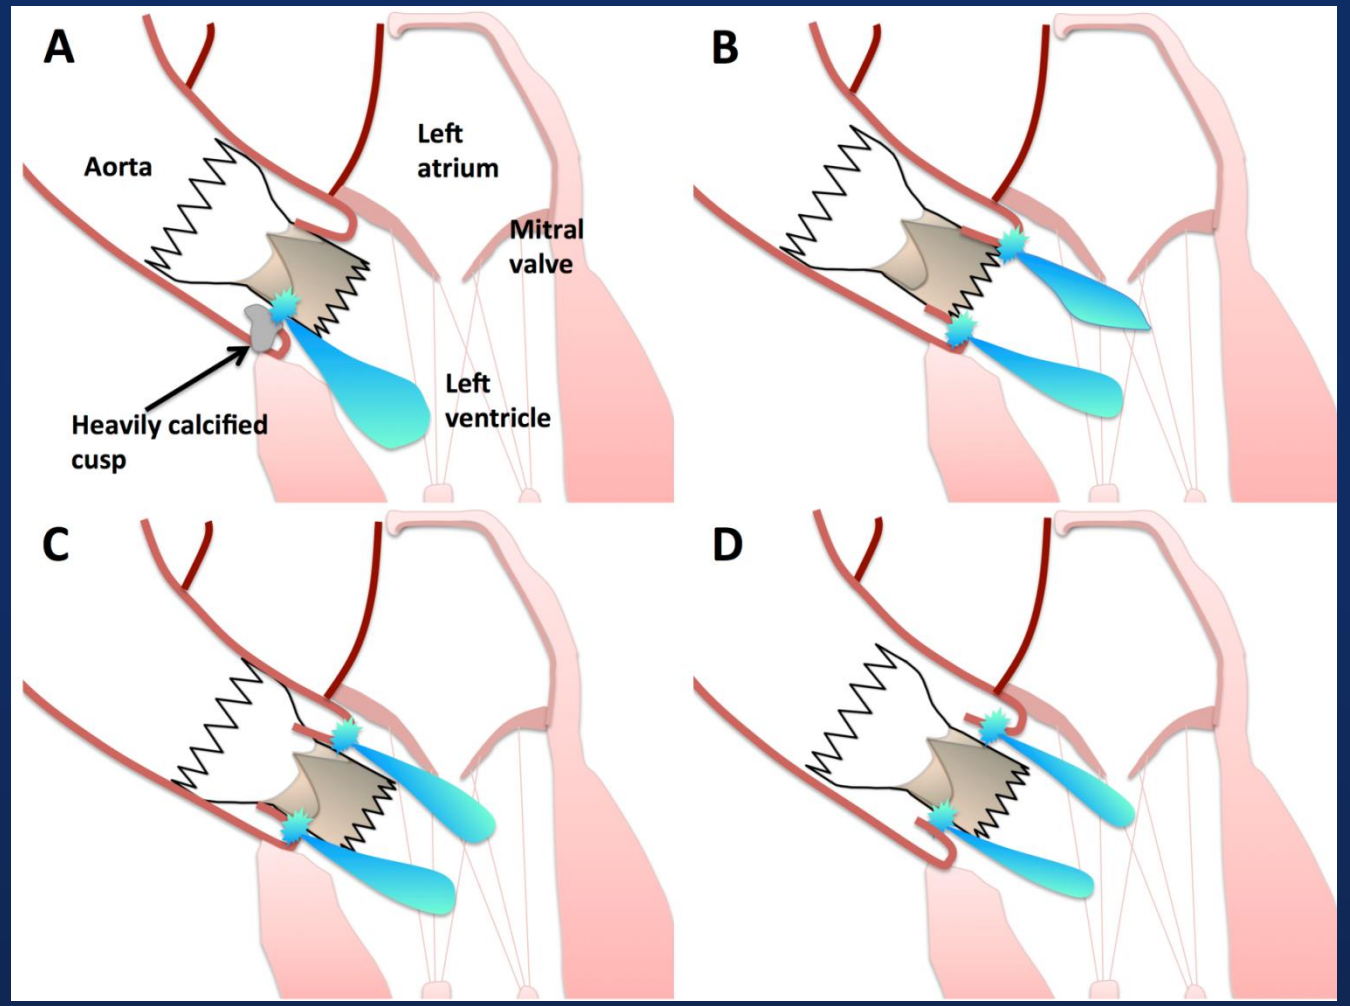
## Mechanism

- **Prosthesis expansion**
  - Geometry and degree of apposition
- **Prosthesis apposition**
  - Larger coronal/sagittal annulus diameter
  - Higher calcium score/Heavily calcified commissure
  - More ellipsoid valves
- **Inadequate prosthesis size**
  - Prosthesis-annulus cover index

$$= \frac{100 \times (\text{prosthesis} - \text{TEE annulus}) \text{ diameter}}{\text{prosthesis diameter}}$$

- **Improper prosthesis positioning**

# Mechanism of PVL



Sinning JM et al., JACC 2012

# Incidence, Predictors, and Outcomes of AR after TAVR

**Meta-analysis of 45 studies involving 12,926 patients treated with CoreValve (n = 5,261) or Edwards valves (n = 7,279).**

- Incidence of moderate/severe AR was 11.7%
- More common with CoreValve than with Edwards(16.0% vs. 9.1%; *P* = 0.005)
- Moderate/severe AR increased mortality at 30 days (OR 2.95; 95% CI 1.73-5.02) and 1 year (HR 2.27; 95% CI 1.84-2.81)
- Even mild AR was linked to mortality in some studies
- Predictors of moderate/severe AR were valve undersizing, aortic valve calcification, and implantation depth

**Implications: Aortic regurgitation is fairly common after TAVR and appears to increase mortality even when mild.**

Athappan G, et al. J Am Coll Cardiol. 2013;61:1585-1595.

# Vascular Complication

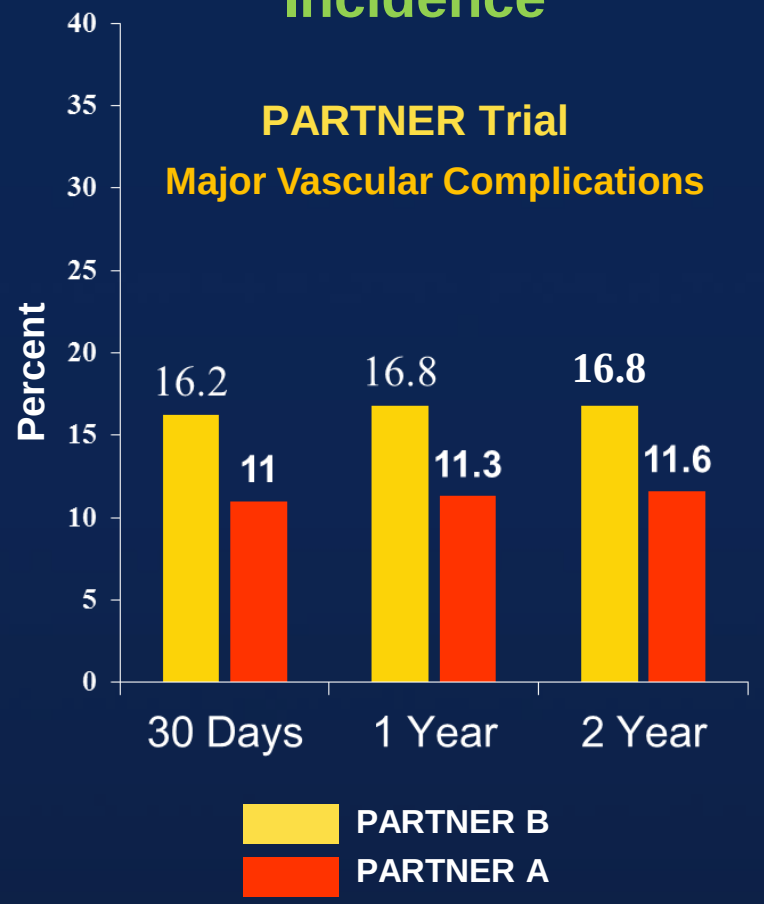
## Type

- Posterior wall puncture / High stick
- Dissection
- Perforation
- Closure device failure
- Foreign body embolization

## Potential Risk Factors

- Operator related : poor screening, Aggressive manipulation, Not prepared for complication
- Patient related : Vessel size, Tortuousity, Calcification, Atherosclerosis
- Device related : Sheat size, Delivery system, Wire, Pacemaker, BAV balloon, Closure device

## Incidence



# Coronary Obstruction

## Possible Causes

- LMT ostium close to the annulus
- Bulky calcific deposit on left cusp
- Long left location of the LMT ostium
- Narrow aortic root with shallow sinuses of valsalva
- Oversized valve
- Pliable, minimally calcific left leaflet
- Proximal septal bulge
- Aortic atherosclerosis near to the ostium
- Embolism
- Improper valve position

# Risk of Coronary Obstruction

## *Multifactorial*

- Women
- Low Coronary Height (<10mm to <12mm)
- Shallow Sinus of Valsalva (<30mm)
- Long Leaflet
- Left Coronary Artery
- Bulky Calcification
- Valve Implantation Height
- Device (Balloon Expandable)

# Subclinical leaflet thrombosis in surgical and transcatheter bioprosthetic aortic valves: an observational study

## Study Design

657 patients underwent CTs in the RESOLVE registry Cedars-Sinai Medical Center, Los Angeles

274 patients underwent CTs in the SAVORY registry Rigshospitalet, Copenhagen

931 patients undergoing CTs

890 patients with interpretable CTs were included in the analysis
RESOLVE registry: 626 patients
SAVORY registry: 264 patients
Median time from AVR to CT 83 days (IQR 32-281 days)

752 transcatheter valves
Median time from TAVR to CT
58 days (IQR 32–236 days)

138 surgical valves
Median time from SAVR to CT
162 days (IQR 79–417 days)

Time from TAVR to CT vs. SAVR to CT: p<0.0001

Chakravarty T, et al. Lancet. 2017 Mar 19. [Epub ahead of print]

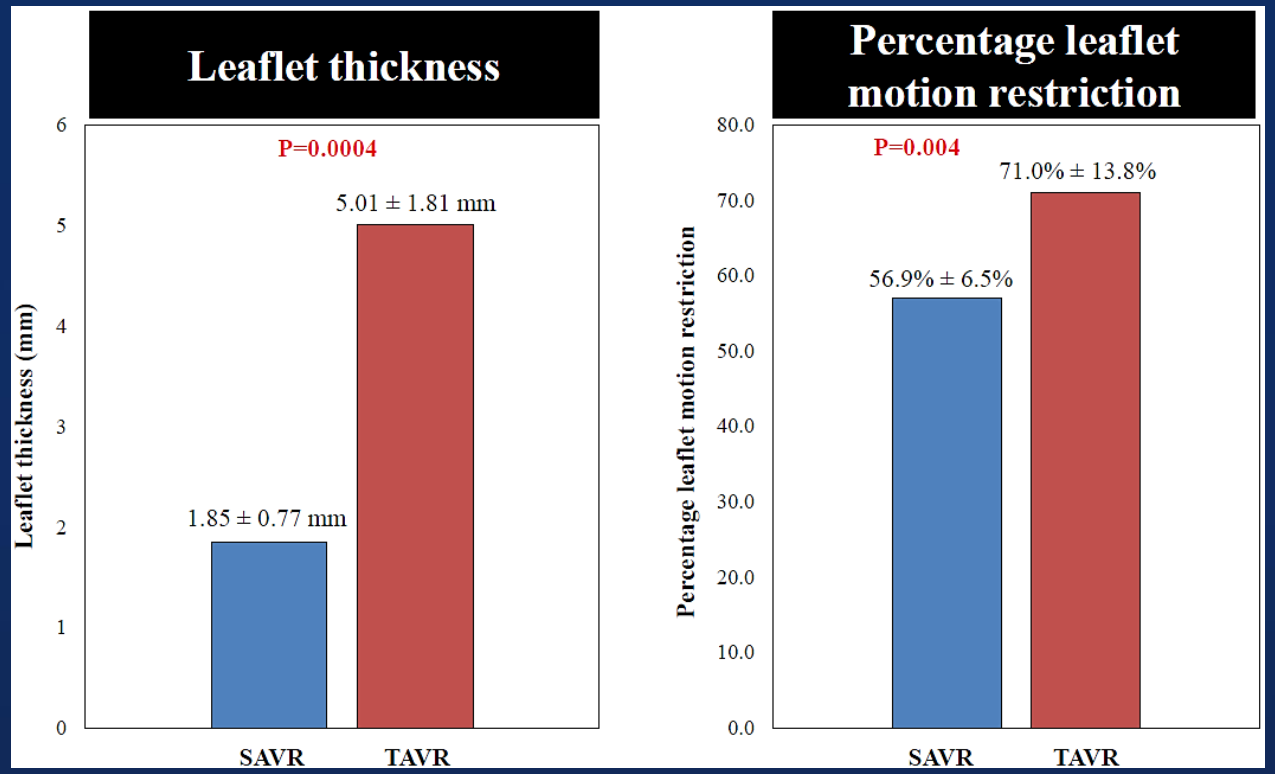
# Prevalence of reduced leaflet motion

Transcatheter vs. surgical bioprosthetic aortic valves: p=0.001

Reduced leaflet motion 106 (11.9%) patients

Transcatheter valves 13.4% (101 out of 752)

Surgical valves 3.6% (5 out of 138)



Chakravarty T, et al. Lancet. 2017 Mar 19. [Epub ahead of print]

# Apixaban vs. VKA vs. DAPT after TAVR

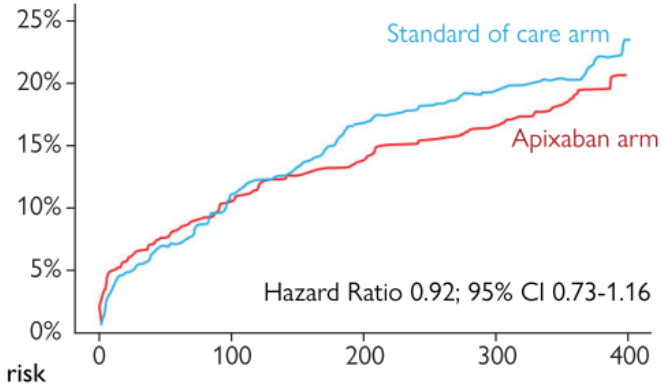
## The ATLANTIS trial

### Primary endpoint (Intent-to-treat)

Time to death, stroke, MI, systemic embolim, intracardiac or valve thrombosis, VT/PE, major bleedings



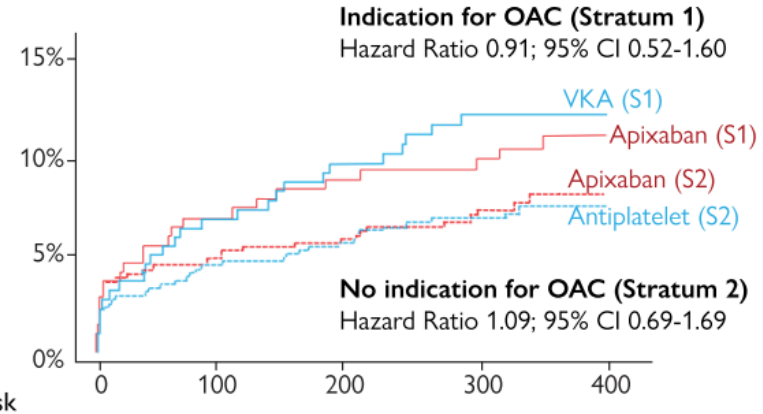
| No at risk | | | | | |
|---|---|---|---|---|---|
| SOC | 751 | 646 | 583 | 555 | 42 |
| Apixaban | 749 | 645 | 612 | 585 | 27 |

| | Apixaban (n= 749) | Standard-of-care (n= 751) | $P_{ist}$ | Hazard ratio (95% CI) |
|---|---|---|---|---|
| Primary outcome | 138 (18.4%) | 151 (20.1%) | | 0.92 (0.73-1.16) |
| No indication for OAC (n=1049) | 89 (16.9%) | 101 (19.3%) | 0.57 | 0.88 (0.66-1.17) |
| Indication for OAC (n=451) | 49 (21.9%) | 50 (21.9%) | | 1.02 (0.68-1.51) |

- Per-protocol analysis (n=1299) were consistent with ITT analyses for the primary endpoint (HR 0.98; 95% CI 0.71-1.13)
- Non-inferiority of apaxiban versus the atandard of care was demonstrated for the primary endpoint using a prespecified non-inferiority margin for the upper boundary of the hazard ratio of 1,2

### Safety analysis

(Primary safety : BARC 4, 3a, 3b and 3c)

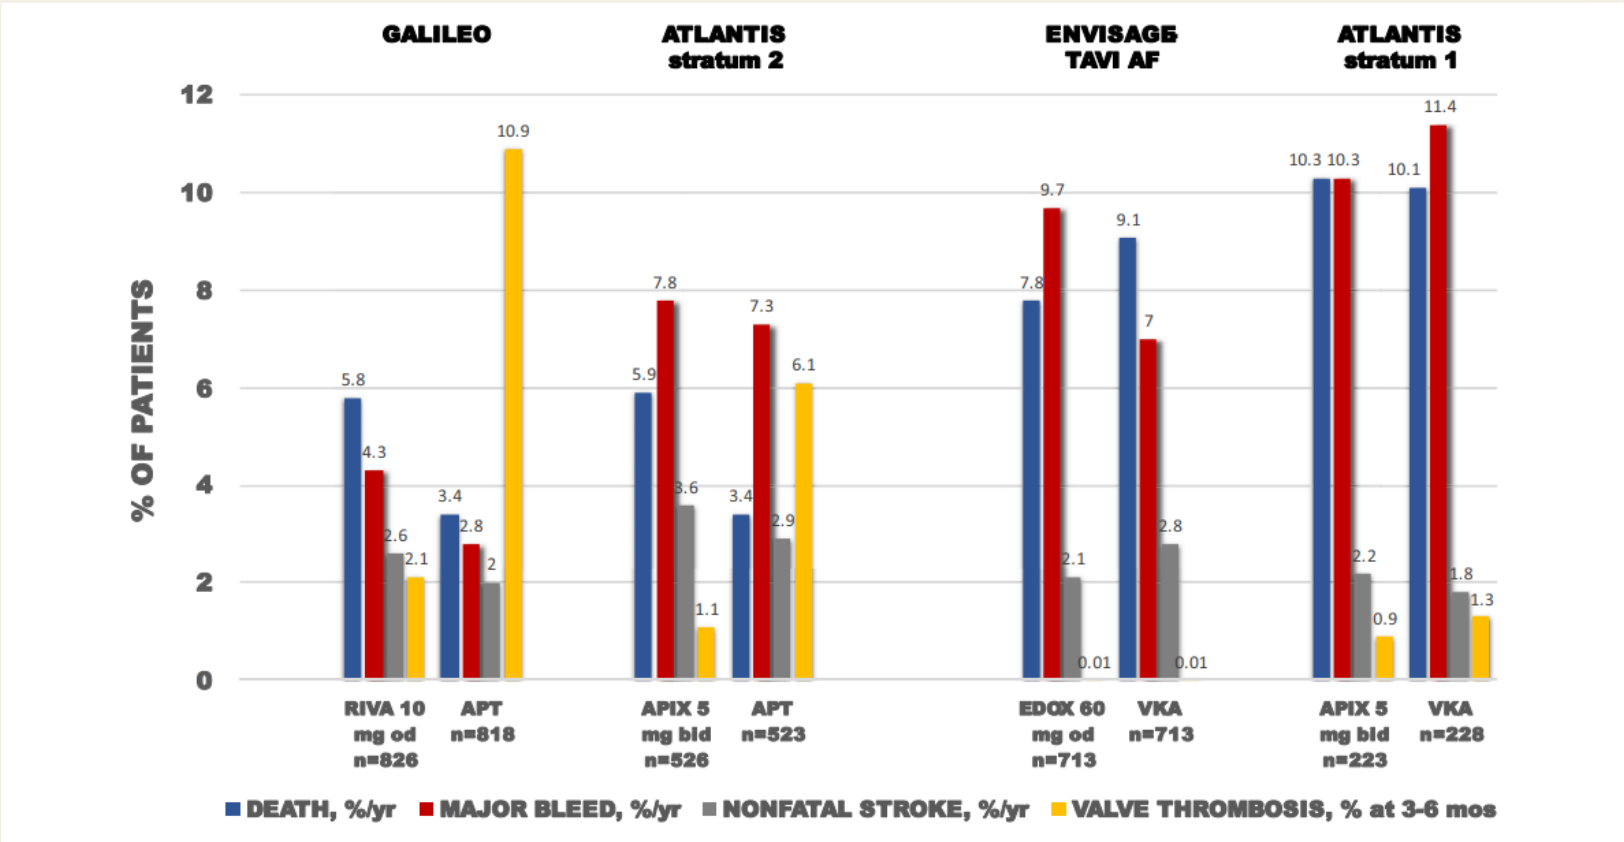


| No at risk | | | | | |
|---|---|---|---|---|---|
| VKA (S1) | 228 | 196 | 180 | 170 | 14 |
| Apixaban (S1) | 223 | 188 | 177 | 167 | 10 |
| Antiplat(S2) | 526 | 479 | 459 | 441 | 18 |
| Apixaban (S2) | 523 | 480 | 457 | 441 | 31 |

| | Apixaban (n= 749) | Standard-of-care (n= 751) | Hazard ratio (95% CI) |
|---|---|---|---|
| Primary safety endpoint† | 64 (8.5%) | 64 (8.5%) | 1.02 (0.72-1.44) |
| Life-threatening bleeding | 19 (2.5%) | 18 (2.4%) | 1.06 (0.55-2.02) |
| Major bleeding | 50 (6.7%) | 48 (8.4%) | 1.07 (0.72-1.59) |
| Major bleeding (BARC 2 or 3a) | 70 (9.3%) | 78 (10.4%) | 0.91 (0.66-1.26) |
| Any bleeding† | 174 (23.2%) | 170 (22.6%) | 1.05 (0.85-1.30) |

†Life-threatening (including fatal) or disabling or major bleeding (BARC 4, 3a, 3b and 3c), as defined by Valve Academic Research Consortium-2 (VARC-2).

Jean-Philippe Collet et al. Eur Heart J 2022;43:2783-2797



**Graphical Abstract** **Major outcomes of randomized controlled trials investigating direct oral anticoagulants in patients undergoing successful TAVI.** 'Non-fatal stroke' refers to ischaemic stroke in GALILEO[5] and ENVISAGE-TAVI AF,[6] and to any stroke/transient ischaemic attack/systemic embolism in ATLANTIS.[13] 'Valve thrombosis' refers to RLM of >50% of ≥1 leaflet(s) (i.e. grade 3–4) in GALILEO,[8] to transprosthetic mean gradient ≥20 or ≥10 mmHg above previous measurements or HALT/RLM grade 3–4 in ATLANTIS,[13] and to thrombosis of haemodynamic relevance, symptomatic or completely reversible by high-intensity anticoagulation or to HALT/RLM or transprosthetic mean gradient ≥20 or ≥10 mmHg above previous measurements in ENVISAGE-TAVI AF.[6] Apix = apixaban; APT = antiplatelet therapy alone; bid = twice daily; Edox = edoxaban; HALT = hypo-attenuated leaflet thickening; od = once daily; Riva = rivaroxaban; RLM = reduced leaflet motion; VKA = vitamin K antagonist.

Felicita Andreotti et al. Eur Heart J 2022;43:2798-2800

# ADAPT-TAVR Trial

## Anticoagulant versus Dual Antiplatelet Therapy for Preventing Leaflet Thrombosis and Cerebral Embolization After Transcatheter Aortic Valve Replacement

# Treatment Group

- **Edoxaban group**

  : Take 60 mg of edoxaban (Lixiana, Daiichi Sankyo, Korea) once daily for at least 6 months

  : 30mg once a day if Wt ≦ 60kg, renal insufficiency (15 ≤ CrCL ≤ 50 mL / min)

- **DAPT group**

  : Take aspirin (75-100 mg) and clopidogrel (75 mg) once daily for at least 6 months

# Cardiac CT imaging

- For all patients enrolled in this trial, CT (four-dimensional, volume-rendered) will be performed at 6 months (± 1 month) after the index TAVR procedure to confirm the
- presence of the leaflet thrombosis of THV
- quantitative assessment of leaflet motion

- Leaflet motion; defined as normal, mildly reduced (<50% reduction), moderately reduced (50 to 70% reduction), severely reduced (>70% reduction), or immobile (lack of motion in at least one valve leaflet) in at least one valve leaflet

# Brain MRI imaging

- For all patients enrolled in this trial, diffusion weighted (DW) brain MRI imaging using a 3-T scanner will be performed at 1-7 days and 6 months post-TAVR procedure

- Follow-up MRI imaging will be matched with immediate post-TAVR scans, and subtraction analyses are performed to identify new lesions in the entire brain. MRI outcomes included calculation of number and volume of new DWIs (postprocedure – 6 months) by subtraction of the existing baseline lesions in the whole brain.

# Neurological and neurocognitive function assessment

- All study subjects will undergo detailed neurologic and cognitive assessment at 1-7 days (baseline) and 6 months post-TAVR procedure

- Neurologic assessments included standard clinical scales (the National Institutes of Health Stroke Scale [NIHSS] and the modified Rankin Scale [mRS]), and cognitive assessments included the Montreal Cognitive Assessment (MoCA).

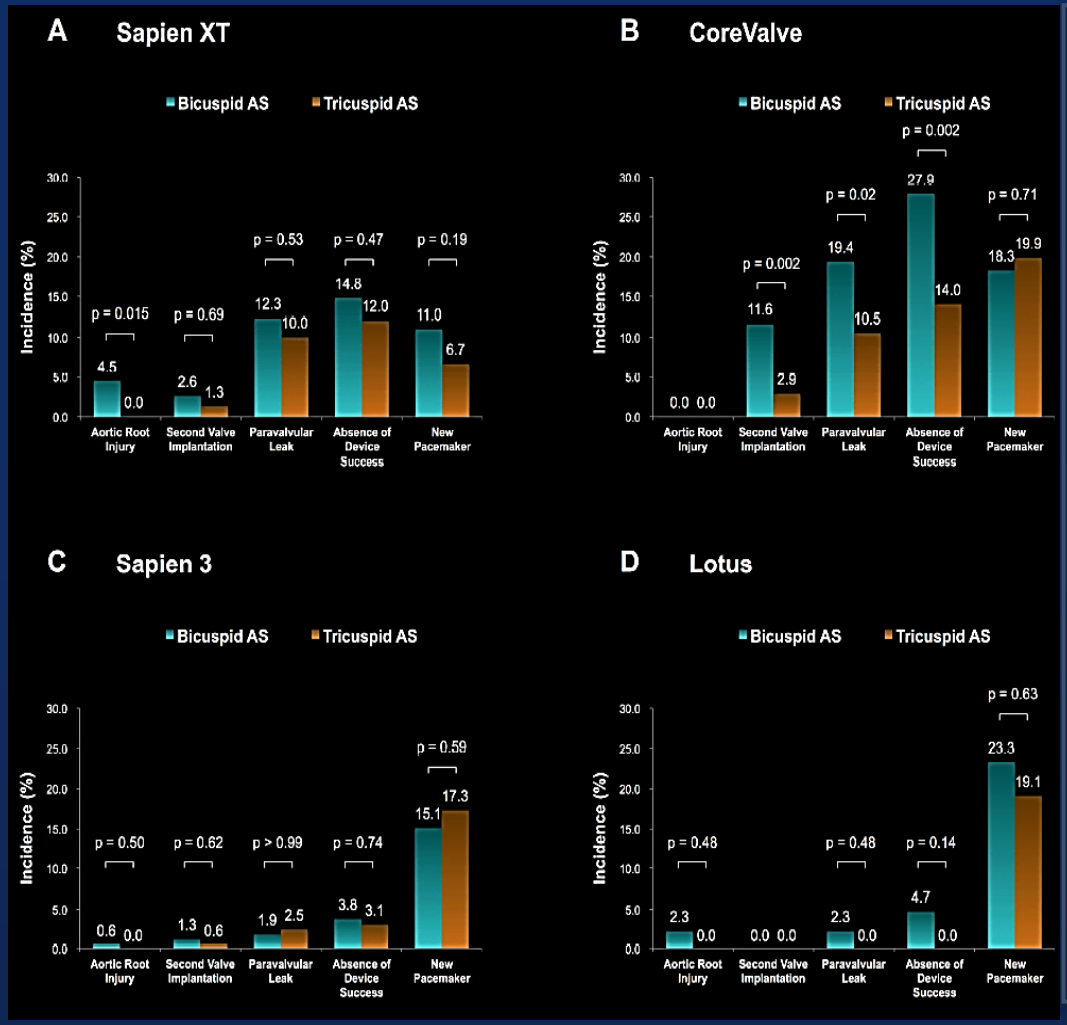
# Procedural and Clinical Outcomes in Transcatheter Aortic Valve Replacement for Bicuspid Versus Tricuspid Aortic Valve Stenosis



Within the group receiving early generation devices, bicuspid AS had more frequent

- aortic root injury when receiving the Sapien XT (4.5% vs. 0.0%; p=0.015)
- Moderate to severe PVL when receiving the CoreValve (19.4% vs. 10.5%; p=0.02)
- Among patients with new generation devices, procedural results were comparable across different prostheses.

# Outcomes of TAVR with Sapien3 Valve in Bicuspid Aortic Stenosis:

## An analysis of the STS/ACC TVT Registry

# STS/ACC TVT Registry
## Background & Objective

- Bicuspid aortic valve accounts for up to 50% of patients requiring surgical aortic valve replacement in the younger population[1]
- As TAVR becomes a therapeutic option for younger and healthier patients, bicuspid aortic valves will be seen more often.
- Pivotal clinical trials, including the low risk trials enrolling younger patients, have excluded patients with bicuspid aortic valves.
- We sought to compare the outcomes of TAVR with balloon-expandable SAPIEN 3 valve in native bicuspid versus tricuspid aortic valve stenosis in the real-world ST S/ACC TVT Registry.

# STS/ACC TVT Registry
## Methods

- **Primary end-point:** Mortality and Stroke at 30-days and 1-year.

- **Secondary end-point:** Procedural complications, in-hospital adverse events, post-procedural echocardiographic assessment of the valve, functional status and health status at 30 days and 1 year.

- To compare death and stroke between bicuspid and tricuspid cohorts, the patients in the study cohort were linked with Centers for Medicare and Medicaid Services (CMS) claims data, in addition to the follow-up obtained from the TVT registry.

SH Yoon and Raj R. Makkar, Euro PCR 2019

# Conclusion

- **BAV morphology** such as ***calcified raphe and excess leaflet calcification*** were independently associated with increased procedural complications and 2-year all-cause mortality

- The impact of BAV morphology on outcomes was consistent in low surgical risk patients as well as in patients who had TAVR with newer generation devices

- Aortopathy was not independently associated with all-cause
mortality

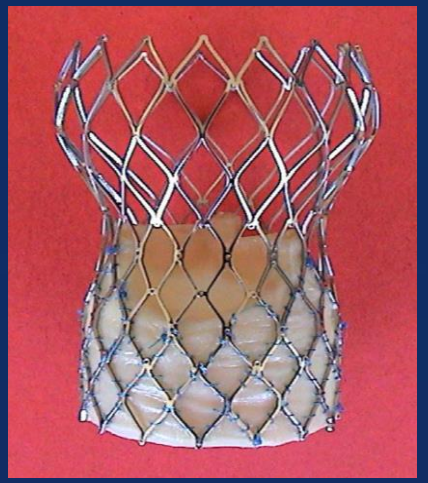
# Optimal TAVR for Bicuspid AV

- We need more experiences
- Case selection
- Balloon sizing: Do NOT select too oversize-device in balloon expandable device!
- TAVR for tricuspid and bicuspid AS showed similar long-term mortality. New devices showed better outcomes.
- Relatively high risk of PPM should be considered in younger pts.
- The selected patients with bicuspid AV stenosis would be a candidate of TAVR with better devices.

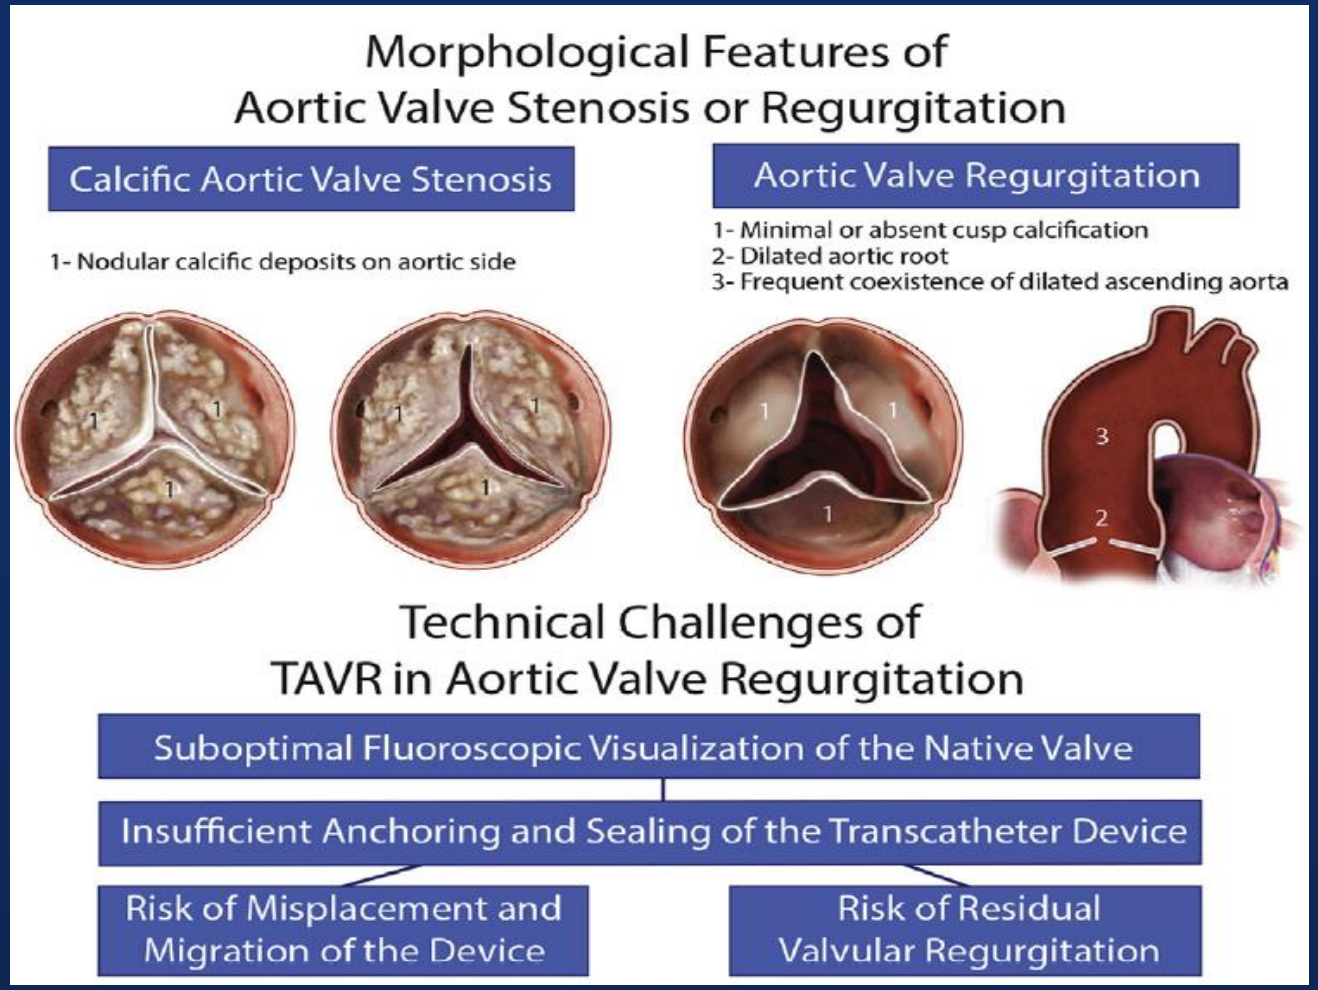
# TAVR for AR

# First case

- 1st Generation 25F CoreValve
- 2004 - 2005
- 21 Aug 2004 for Pure AR
- 12 Jul 2004 for ASR



# Technical challenges for current TAVI systems



Franzone, et. al. , J Am Coll Cardiol Intv 2016

# Early evidence

Self expanding CoreValve

- Better for anchoring in the absence of calcification
- Less risk of annular rupture during deployment
- Better to treat larger anatomies

In early 2 studies

- High early mortality
- Less permanent pacemaker (lack of calcification)
- High rates of PVL and second valve

# Jena valve

- Self-expanding Nitinol frame with flexible stent posts
- Porcine root valve
- Clip fixation of native leaflets
- Rapid pacing not required
- Annular range:  21 – 27 mm
  - 3 valve sizes:  23, 25, 27 mm
- 32Fr introducer sheath

# Jena valve

## Trans-apical, severe AR, 31 patients, mean age 73.8 ± 9.1, EuroSCORE 23.6 ± 14.5

**TABLE 3 VARC-2 Defined Endpoints**

| | |
|---|---|
| Myocardial infarction | 0 |
| Cerebrovascular event | 0 |
| Bleeding, major or life-threatening | 3 (9.7) |
| Access site complication | |
| Minor | 1 (3.2) |
| Major | 3 (9.7) |
| Acute kidney injury | |
| Stage 1 or 2 | 6 (19.3) |
| Stage 3 | 1 (3.2) |
| Permanent pacemaker implantation | 2 (6.4)* |
| ICU stay, days | 3.2 ± 2.8 |
| In-hospital stay, days | 10.8 ± 5.6 |
| Device success | 30 (96.8) |
| Combined early safety endpoint, 30 days | 6 (19.3) |
| All-cause mortality, 30 days | 4 (12.9) |
| Cardiac mortality, 30 days | 1 (3.2) |
| All-cause mortality, 6 months | 6 (19.3) |
| Cardiac mortality, 6 months | 1 (3.2) |

- **The only TAVI device which is CE marked for treatment of pure AR**
- **Effectively eliminated PVL and the need for a second valve, which led to high device success**

# J-valve

- Self-expanding Nitinol frame
- Porcine aortic valve
- Clasper—independently operated 3D ring that corresponds to the native sinuses, orients the valve stent, and captures the native leaflets
- Annular range:  19 – 27 mm
- 4 valve sizes:  21, 23,25, and 27 mm
- 27Fr sheathless transapical delivery catheter

# J-valve

**Trans-apical, severe AR, 33 patients,**
**mean age 74.2 ± 5.2, EuroSCORE 24.4 ± 5.1**

| Outcomes | |
|---|---|
| Device Success | 94% |
| 2nd Valve | 0% |
| Conversion to SAVR | 3% |
| 30-Day Mortality | 3% |
| Moderate / Severe PVL | 3% |
| Permanent Pacemaker | 6.10% |

Zhu, et. al. , J Am Coll Cardiol 2016

# Evolut R

- Self-expanding Nitinol frame
- Porcine pericardial supra-annular valve
- Optimized sealing:  extended skirt and more conformable frame
- Recapturable
- Annular range:  18 – 30 mm
- 4 valve sizes:  23, 26, 29, 34 mm
- 14Fr –equivalent profile, vessels ≥ 5.0 mm
- 34 mm system:  16Fr-equivalent, vessels ≥ 5.5 mm

# JenaValve Trilogy Heart Valve

- Self-expanding Nitinol frame
- Porcine pericardial tissue
- Locator clip onto native leaflets forming a natural seal
- Needs no calcium to anchor
- Less permanent pacemaker

- Annular range:  21 – 27 mm
  - 3 valve sizes:  23, 25, 27 mm
- Transfemoral access with an 18Fr profile

# Accurate neo 2 THV

- Self-expanding Nitinol frame
- Porcine pericardial tissue
- Top-down deployment

- Annular range:  20 – 26.3 mm
  - 3 valve sizes
    - S: 20.0 – 22.4mm
    - M: 22.5 – 24.3mm
    - L: 24.4 – 26.3 mm
- Transfemoral access with an 18Fr profile

# Accurate neo 2 THV

## Pure non-calcified AR TAVR, total 9 patients, logEuroSCORE II 5.5 ± 3.6%, STS PROM 6.2 ±3.0%

| | Study group ($n$ = 9) |
|---|---|

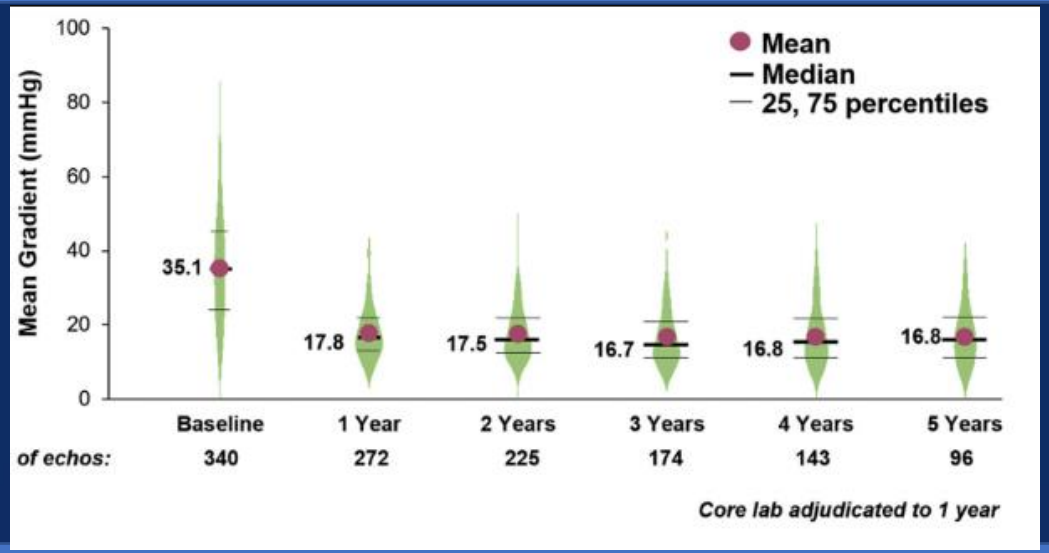
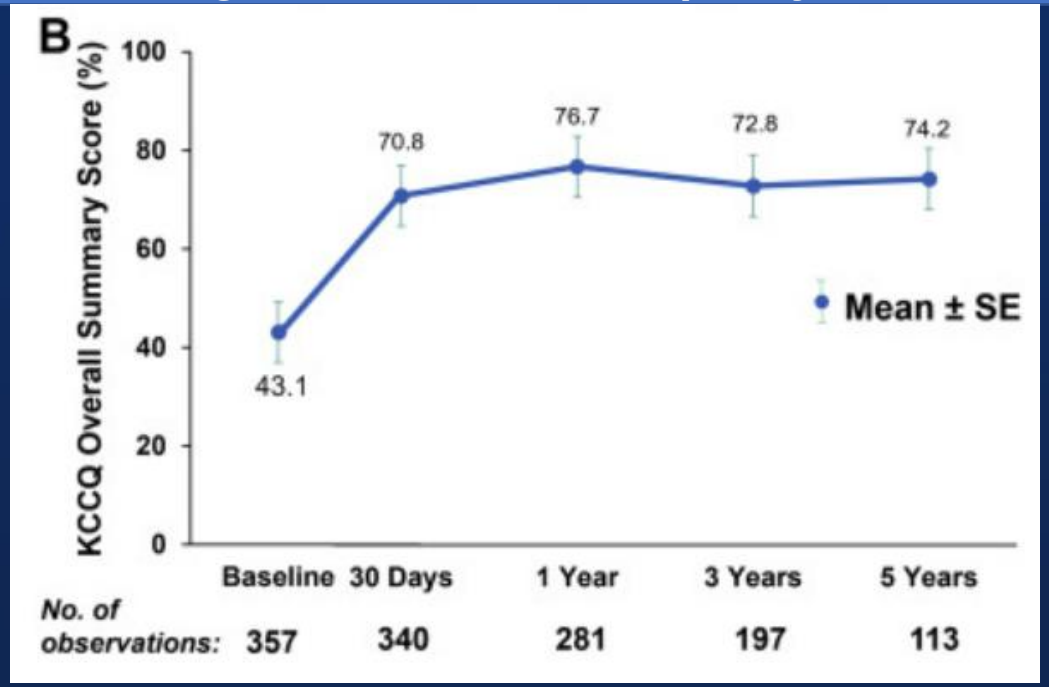
| SVD-Related BVF | 273 | 253 | 205 | 162 | 131 | 92 |

Hahn RT, et al. J Am Coll Cardiol Intv. 2022;15(7):698-708.

## A. Changes in hemodynamics



## B. Changes in function and quality of life



Hahn RT, et al., JACC Cardiovasc Interv. 2022 Apr 11;15(7):698-708.

# Hemodynamic Deterioration of Surgically Implanted Bioprosthetic Aortic Valves

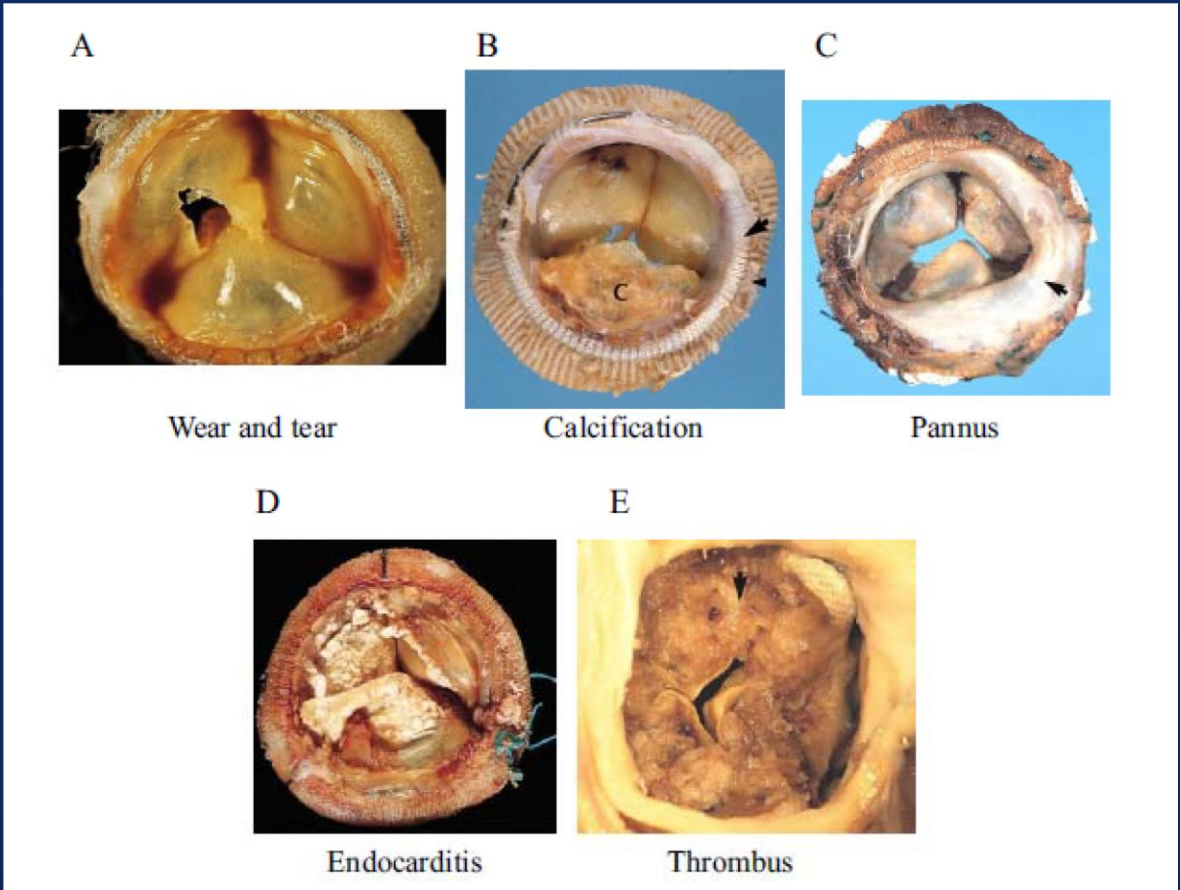
Prospective longitudinal study of 137 patients who had previously undergone bioprosthetic valve surgery.

- 25.6% had leaflet calcification on noncontrast CT at a median of 6.7 years post-SAVR. By a median of 3 years later, 13.1% of pts developed hemodynamic valve deterioration (HVD)
- Leaflet calcification independently predicted the risk of death/reintervention (HR 2.58; 95% CI 1.35-4.82), as did HVD (HR 5.12; 95% CI 2.57-9.71)
- Predictors of HVD were leaflet calcification, insulin resistance, increased Lp-PLA2 activity, and high PCSK9 level

**Implications**: Dysmetabolic profile and calcification could be early warning signs of hemodynamic deterioration of bioprosthetic valves.

Salaun E, et al. J Am Coll Cardiol. 2018;72:241-251.

# Most Common Reasons for Bioprosthetic Valve Failure



(A) Wear and tear

(B) Calcific degeneration

(C) Pannus

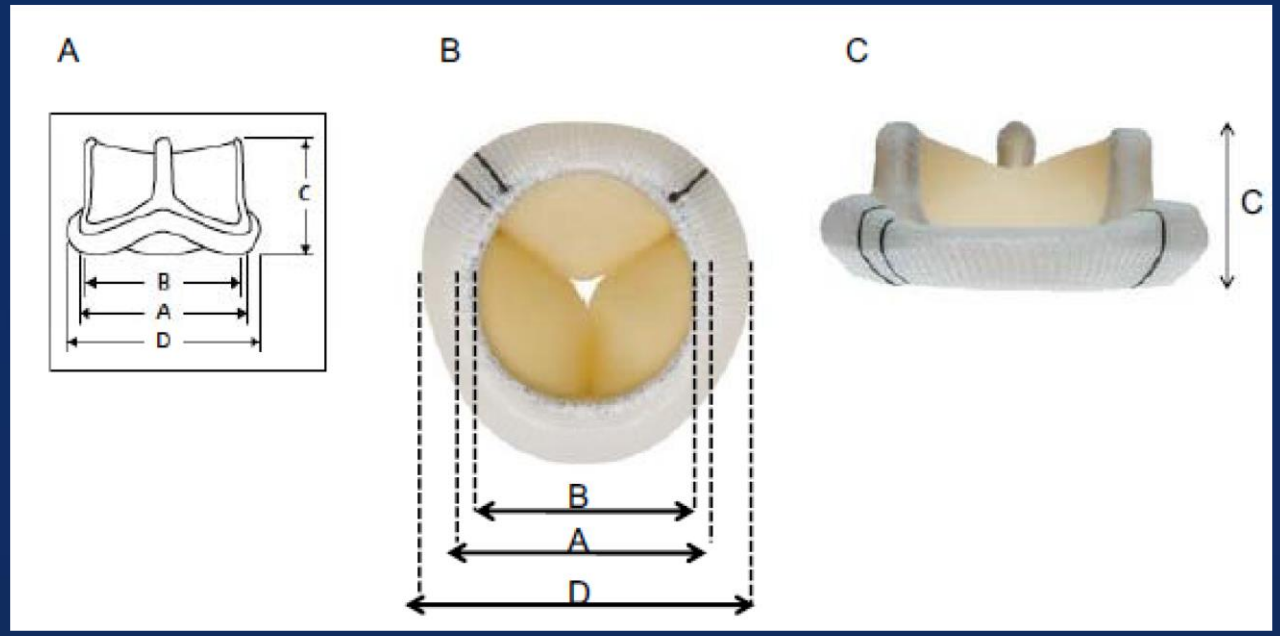
(D) Endocarditis

(E) Thrombus

Wear and tear (A) and calcification (B) are the most common reasons for bioprosthetic valve failure

Piazza, N, et al. JACC Cardiovasc Interv. 2011;4:721-32.

# Dimensions of Stented Bioprosthetic Valves



**( A)** Diagrammatic representation of stented bioprosthetic valve dimensions

A outer stent diameter
B inner stent diameter
C prosthesis height
D outer sewing ring diameter.

**(B)** Inferior (ventricular) view of stented bioprosthesis.

**(C)** Side view of stented bioprosthesis.

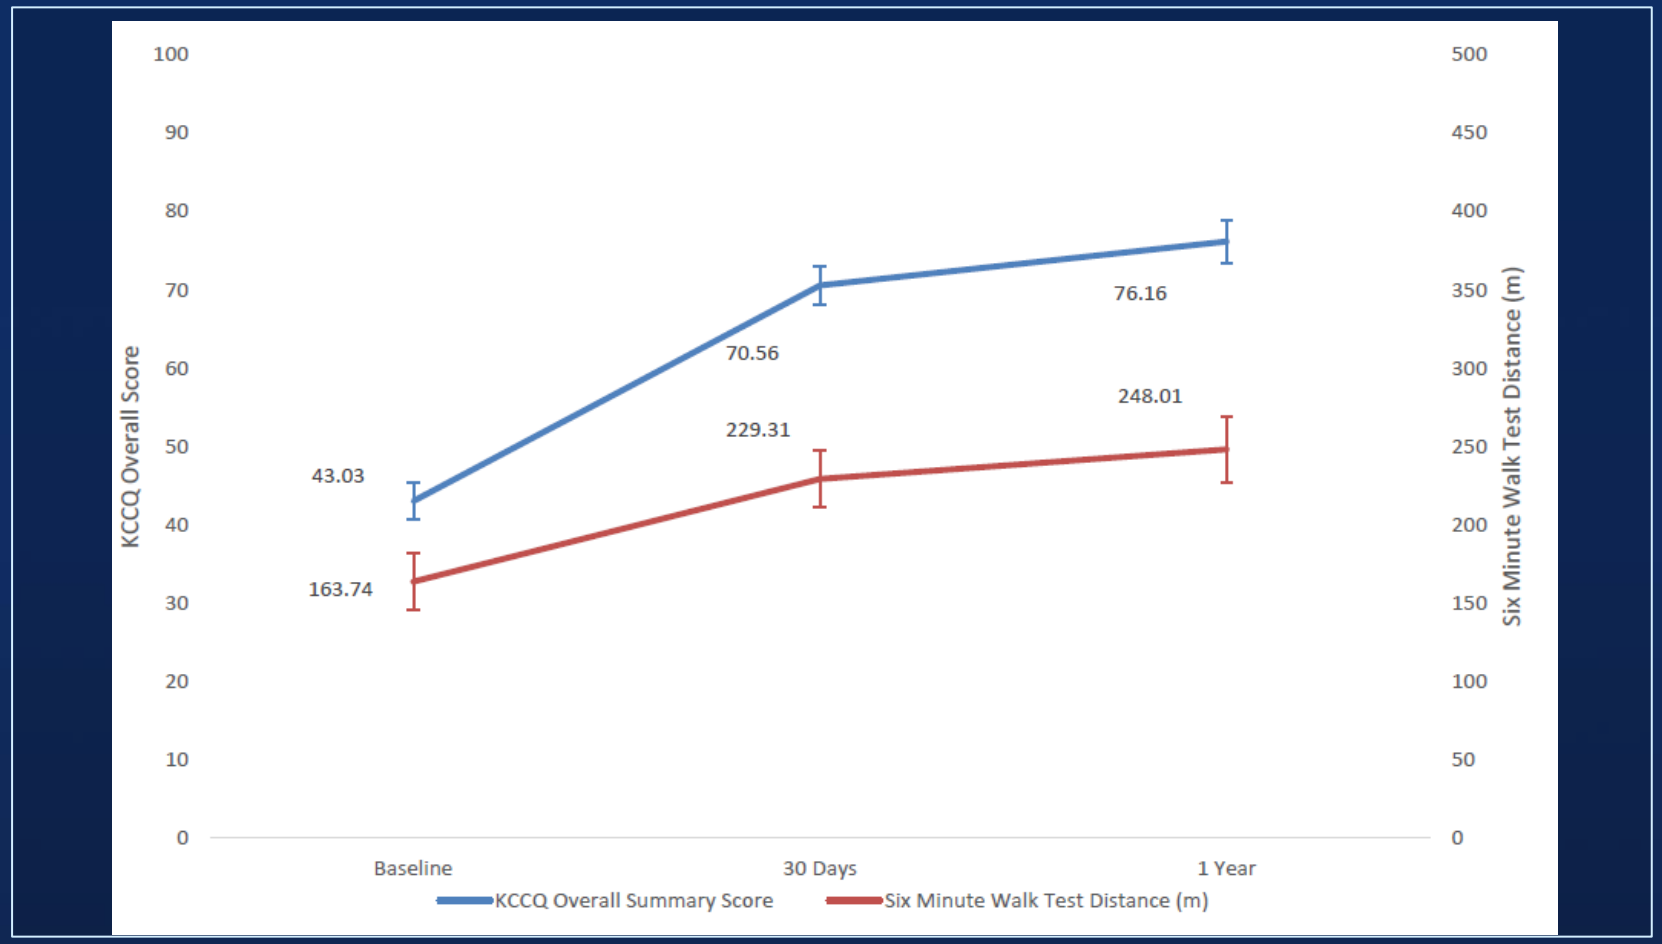
Piazza, N, et al. JACC Cardiovasc Interv. 2011;4:721-32.

# TAVR for degenerative bioprosthetic surgical valves: Valve-in-Valve Registry

- **Treating a failed bioprosthesis via TAVR**
  Feasible and often effective but technically demanding
- **The Global Valve-in-Valve Registry**
  - 416 high-risk patients
  - 54 centers in Europe, North America, Australia, New Zealand, and the Middle East
  - 225 Sapien (Edwards) /190 CoreValve /1 Melody (Medtronic)
- **"Relatively high rates" of Complications**
  - initial device malapposition / attempted valve retrieval
  - implantation of a second device
  - post-implantation valvuloplasty
  - need for emergent surgery
  - clinically-evident coronary obstruction
- **Improvement of functional capacity at 30 days**
  **87.5% of patients classified as NYHA class I/IIs**

Danny Dvir, MD, Washington Heart Center

# Aortic Valve-in-Valve is an effective procedure



PARTER NR3 viv. JACC 2017

# TAVR for degenerative bioprosthetic surgical valves

## Valve-in-Valve Registry

| Mortality at 30 Days | | | | |
|---|---|---|---|---|
| | Mechanism of bioprosthetic valve failure | | | |
| | Stenosis (n = 168) | Regurgitation (n = 125) | Combined (n = 123) | *P* Value |
| All-Cause | 10.9% | 4.1% | 6.7% | 0.09 |
| Cardiovascular | 9.8% | 3.3% | 5.8% | 0.08 |

- Registry shows valve-in-valve procedure via TAVR can effectively treat failed bioprostheses
- Poorest outcomes seen in patients with stenosis vs regurgitation or combination of both
- Technically challenging procedure best performed by experienced operators

Danny Dvir, MD, Washington Heart Center

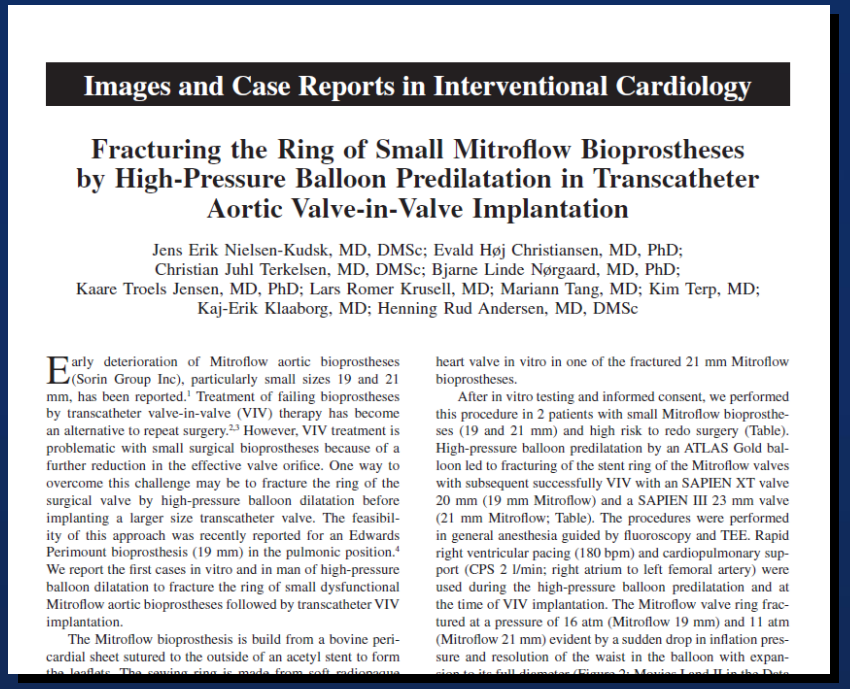
# Fracturing the Ring of small bioprostheses



Images and Case Reports in Interventional Cardiology

**Fracturing the Ring of Small Mitroflow Bioprostheses by High-Pressure Balloon Predilatation in Transcatheter Aortic Valve-in-Valve Implantation**

Jens Erik Nielsen-Kudsk, MD, DMSc; Evald Høj Christiansen, MD, PhD; Christian Juhl Terkelsen, MD, DMSc; Bjarne Linde Nørgaard, MD, PhD; Kaare Troels Jensen, MD, PhD; Lars Romer Krusell, MD; Mariann Tang, MD; Kim Terp, MD; Kaj-Erik Klaaborg, MD; Henning Rud Andersen, MD, DMSc

Early deterioration of Mitroflow aortic bioprostheses (Sorin Group Inc), particularly small sizes 19 and 21 mm, has been reported.[1] Treatment of failing bioprostheses by transcatheter valve-in-valve (VIV) therapy has become an alternative to repeat surgery.[2,3] However, VIV treatment is problematic with small surgical bioprostheses because of a further reduction in the effective valve orifice. One way to overcome this challenge may be to fracture the ring of the surgical valve by high-pressure balloon dilatation before implanting a larger size transcatheter valve. The feasibility of this approach was recently reported for an Edwards Perimount bioprosthesis (19 mm) in the pulmonic position.[4] We report the first cases in vitro and in man of high-pressure balloon dilatation to fracture the ring of small dysfunctional Mitroflow aortic bioprostheses followed by transcatheter VIV implantation.

The Mitroflow bioprosthesis is build from a bovine pericardial sheet sutured to the outside of an acetyl stent to form the leaflets. The sewing ring is made from soft radiopaque

heart valve in vitro in one of the fractured 21 mm Mitroflow bioprostheses.

After in vitro testing and informed consent, we performed this procedure in 2 patients with small Mitroflow bioprostheses (19 and 21 mm) and high risk to redo surgery (Table). High-pressure balloon predilatation by an ATLAS Gold balloon led to fracturing of the stent ring of the Mitroflow valves with subsequent successfully VIV with an SAPIEN XT valve 20 mm (19 mm Mitroflow) and a SAPIEN III 23 mm valve (21 mm Mitroflow; Table). The procedures were performed in general anesthesia guided by fluoroscopy and TEE. Rapid right ventricular pacing (180 bpm) and cardiopulmonary support (CPS 2 l/min; right atrium to left femoral artery) were used during the high-pressure balloon predilatation and at the time of VIV implantation. The Mitroflow valve ring fractured at a pressure of 16 atm (Mitroflow 19 mm) and 11 atm (Mitroflow 21 mm) evident by a sudden drop in inflation pressure and resolution of the waist in the balloon with expan-

# ViV TABR for Degenerated SBAV : Multicenter Retrospective Analysis

- **Among 66 SBAV, Mortality 3.0% at 30 days and 9.6% at 1 year.**
- **At 1 year, LVED was decreased versus baseline : 3.0 [2.6 to 3.6] cm vs. 3.7 [3.2 to 4.4] cm (p < 0.001)**
- **Coronary occlusion (9.1%) resulted in myocardial infarction (3.0%).**
- **Predictors of coronary occlusion**
  **Subcoronary implant technique compared with full root replacement**
  **Short simulated radial valve-to-coronary distance**
  **Low coronary height**

**Conclusions**: TAVR in SBAVs is frequently associated with high-risk coronary anatomy but can be performed with a low risk of death and myocardial infarction, resulting in favorable ventricular remodeling. A subcoronary surgical approach is associated with an increased risk of coronary obstruction.

# VitaFlow Library

- Hybrid density stent with double-layer skirts
- Bovine pericardial leaflet
- Retrievable delivery system
  - Motorized handle
  - Allowed for fast, stable, and accurate release and retrieval
- The delivery system whose distal end can be bent 360 degrees
  - Providing superior flexibility to help minimize blood vessel damage
  - Reducing the risk of complications

Cathet Cardio Intervent, Volume: 95, Issue: 2, Pages: 332-338.

# Mechanically-expandable valves

# Direct Flow Medical Aortic valve

- 2 sizes matching valvuloplasty balloons
- Conformable cuff design and precise positioning
  → Reduces PV Leaks and AI
- “Surgical” valve design
- Repositionable & Removable
- Immediately competent
- Valve design allows hemodynamic assessment prior to final device deployment

* CE approval, anticipated at the end of 2012

REPRISE III
Lotus™ Valve System

# Conclusions

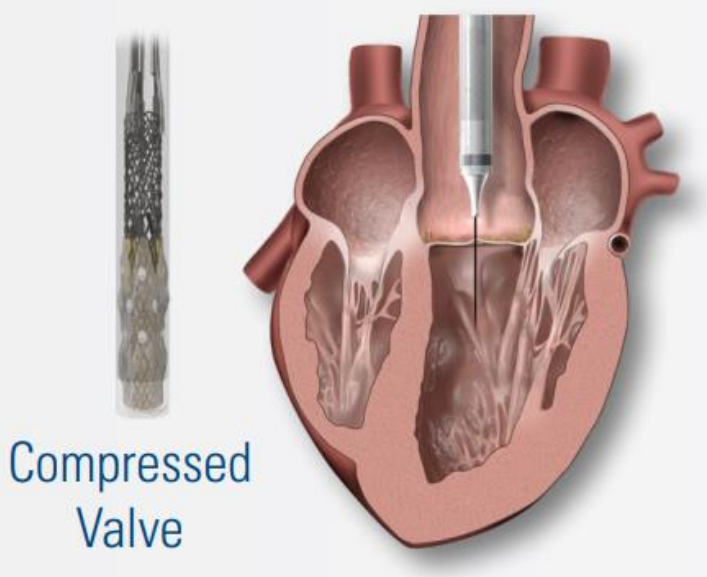
The 2-year findings in REPRISE III continue to demonstrate the safety and effectiveness of the LOTUS valve

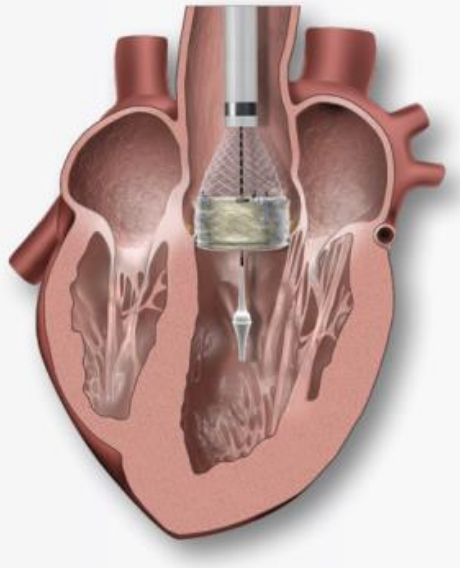
- At 2 years compared to CoreValve LOTUS patients experienced:
  - Less moderate or greater paravalvular leak
  - Fewer disabling strokes
  - Fewer repeat procedures
  - More valve thrombosis
  - More new pacemaker implantations
  - Smaller valve areas and higher gradients
- At 2 years, more LOTUS patients had improvements in NYHA class compared to CoreValve
- Ongoing follow-up will provide safety and performance information on the LOTUS valve to at least 5 years

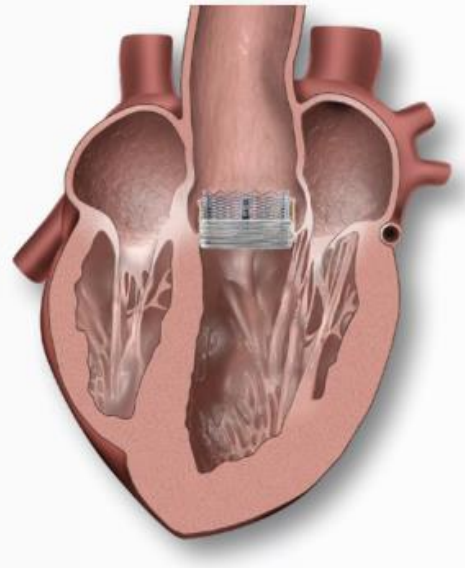
# The LOTUS *Edge*™

- 100% repositionable
- Adaptive Seal around the outside of the valve frame to help reduce PVL

# The LOTUS *Edge*™







**Step 1**

The artificial valve is compressed onto a catheter that travels through the body to the heart, inside of a large blood vessel that leads to the diseased aortic valve.

**Step 2**

The physician expands the replacement valve, pushing the diseased parts of the aortic valve out of the way

**Step 3**

The new valve begins to function immediately and restore healthy blood flow. Once the valve is in place, the physician removes the catheter, closes the incision, and the procedure is complete

# ViV: Mitral Valve

# MITRAL Trial
# Mitral Implantation of TRAnscatheter vaLves

**90 patients extremely high surgical risk (STS PROM >15% or M&M >50%)**

Brian Whisenant, 2020 JAMA

# One-Year Outcomes of Mitral VIV using APIEN 3

| Outcome | No./total No. (%) of patients | | | *P* value |
|---|---|---|---|---|
| | Transseptal (n = 1326) | Transapical (n = 203) | Combined (N = 1529) | |
| 1-y Outcomes | | | | |
| All-cause mortality | 138 (15.8) | 37 (21.7) | 175 (16.7) | .03 |
| All-cause mortality No. at risk | 438 | 97 | 535 | NA |
| Cardiovascular death | 36 (3.7) | 11 (5.7) | 47 (3.9) | .07 |
| Stroke | 27 (3.3) | 5 (3.5) | 32 (3.3) | .95 |
| Mitral valve reintervention | 8 (0.8) | 1 (0.5) | 9 (0.8) | .78 |
| New dialysis requirement | 19 (1.6) | 6 (3.1) | 25 (1.8) | .13 |
| New pacemaker | 21 (2.0) | 5 (2.8) | 26 (2.1) | .44 |
| Device thrombosis | 4 (0.3) | 2 (1.2) | 6 (0.5) | .17 |
| LV ejection fraction, mean (SD), % | 53.3 (11.52) | 52.8 (13.11) | 53.2 (11.76) | .77 |
| Mean MVG, mean (SD), mm Hg | 7.0 (2.94) | 7.0 (2.61) | 7.0 (2.89) | .99 |
| 1-y KCCQ Improvement, mean (SD) | 40.2 (27.26) | 35.3 (26.37) | 39.4 (27.14) | .27 |
| 1-y NYHA class | | | | |
| I | 143/290 (49.3) | 30/62 (48.4) | 173/352 (49.1) | .89 |
| II | 119/290 (41.0) | 26/62 (41.9) | 145/352 (41.2) | .90 |
| III | 23/290 (7.9) | 5/62 (8.1) | 28/352 (8.0) | >.99 |
| IV | 5/290 (1.7) | 1/62 (1.6) | 6/352 (1.7) | >.99 |

# Challenges of Transcatheter TV Therapies

- Large tricuspid annulus size
- Nonplanar and elliptical annulus shape
- Fragility of tricuspid annular tissue and narrower annular shelf in comparison to mitral annulus
- Noncalcified annulus in secondary TR
- Angulation in relation to SVC and IVC
- Trabeculated RV, muscular bands and chordae tendinae
- Thin right ventricular free wall
- Proximity of AV node and right His bundle branch
- Proximity of the RCA to annulus and risk of coronary injury
- Risk of occlusion of coronary sinus, vena cava or outflow tract
- Slow-flow in right ventricle
- Patients with pacemaker or defibrillator leads

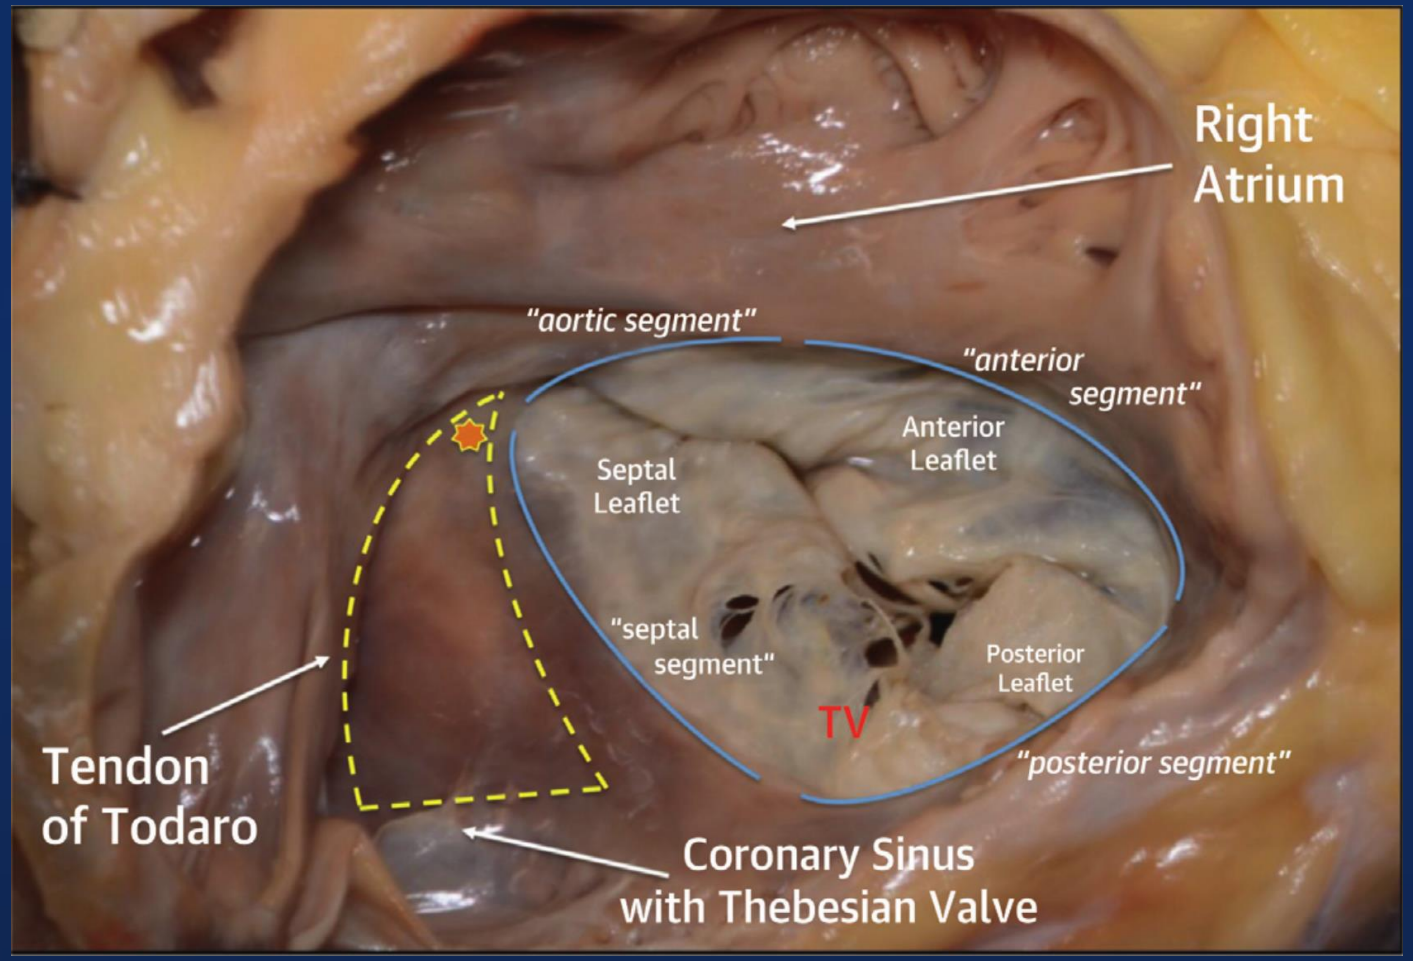
# TV and Surrounding Structures



Asmarats et al. J Am Coll Cardiol. 2018;71(25):2935-56

# Etiologies of TR

| Morphological Classification | Disease Subgroup | Specific Abnormality |
|---|---|---|
| Primary leaflet abnormality: 25% | Congenital | Ebstein's anomaly<br>Tricuspid valve tethering associated with perimembranous VSD and VSA<br>Other (giant right atrium) |
| | Acquired disease | Carcinoid<br>Degenerative (myxomatous)<br>Endocarditis<br>Endomyocardial fibrosis<br>Iatrogenic (pacing leads, RV biopsy)<br>Rheumatic<br>Toxins<br>Trauma<br>Other (e.g., ischemic papillary muscle rupture) |
| Secondary ("functional"): 75% | Left heart disease | LV dysfunction or valve disease |
| | Right ventricular dysfunction | RV cardiomyopathy (e.g., ARVD)<br>RV ischemia<br>RV volume overload |
| | Pulmonary Hypertension | Chronic lung disease<br>Left-to-right shunt<br>Pulmonary thromboembolism |
| | Right atrial abnormalities | Atrial fibrillation |
| Other | Post-operative | Recurrent TR post-surgical intervention |

# TTVI sytems selection

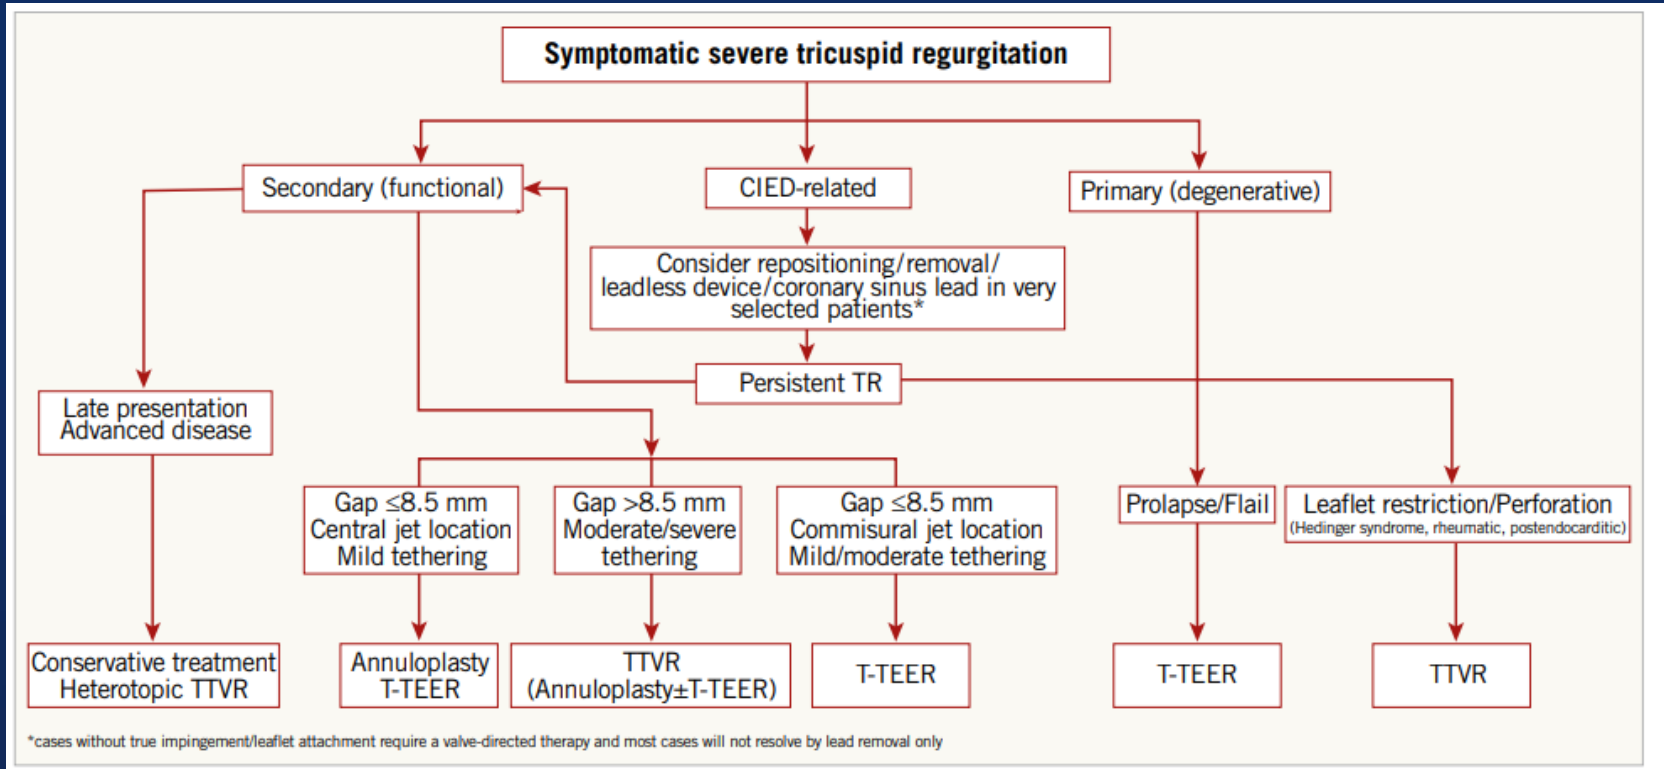


**Figure 6.** *Proposed algorithm for the selection of TTVI systems. CIED: cardiac implantable electronic device; T-TEER: tricuspid transcatheter edge-to-edge repair; TTVR: transcatheter tricuspid valve replacement*

EuroIntervention 2021;17:791-808

# Criteria for device selection

**Table 3. Anatomical criteria for device selection.**

| Strategy | Favourable anatomy | Feasible anatomy | Unfavourable anatomy |
|---|---|---|---|
| Leaflet approximation | Small septolateral gap ≤7 mm[10]<br>Anteroseptal jet location<br>Confined prolapse or flail<br>Trileaflet morphology | Septolateral coaptation gap >7 but ≤8.5 mm[65]<br>Posteroseptal jet location<br>Non-trileaflet morphology<br>Incidental CIED RV lead (i.e., without leaflet impingement) | Large septolateral coaptation gap >8.5 mm[65]<br>Leaflet thickening/shortening (rheumatic, carcinoid)/perforation<br>Dense chordae with marked leaflet tethering<br>Anteroposterior jet location<br>Poor echocardiographic leaflet visualisation<br>CIED RV lead leaflet impingement<br>Unfavourable device angle of approach |
| Annuloplasty | Annular dilatation as primary mechanism of TR<br>Mild tethering (tenting height <0.76 cm, tenting area<1.63 cm², tenting volume [3D] <2.3 mL)[110,111]<br>Central jet location<br>Sufficient landing zone for anchoring | Moderate tethering (tethering height ≥0.76 cm but <1.0 cm, tenting area >1.63 but <2.5 cm², tenting volume [3D] ≥2.3 mL but ≤3.5 mL)[110,111]<br>Incidental CIED RV lead (i.e., without leaflet impingement) | Excessive annular dilatation (exceeding device size)<br>Severe tethering (tethering height >1.0 cm, tenting volume >3.5 mL). Poor echocardiographic annular visualisation[110,111]<br>Annular proximity of RCA<br>CIED RV lead leaflet impingement |
| Orthotopic valve implantation | Previous surgical repair or bioprosthetic valve replacement<br>Leaflet thickening/shortening (rheumatic, carcinoid)<br>Incidental CIED RV lead (i.e., without leaflet impingement)<br>Any leaflet morphology | Large coaptation gap<br>CIED RV lead leaflet impingement | Excessive annular dilatation (exceeding device size)<br>Unfavourable device angle of approach<br>Severe right ventricular dysfunction |
| Heterotopic valve implantation | Appropriate caval diameters (and intercaval distance)<br>No option for direct valve treatment | | Proximity of the RA to the orifice of the liver veins (<10-12 mm)<br>Severely increased pulmonary artery and RA pressures due to the risk of fracture of bicaval valved stents |

3D: three-dimensional; CIED: cardiac implantable electronic device; RA: right atrium; RCA: right coronary artery; RV: right ventricular; TR: tricuspid regurgitation

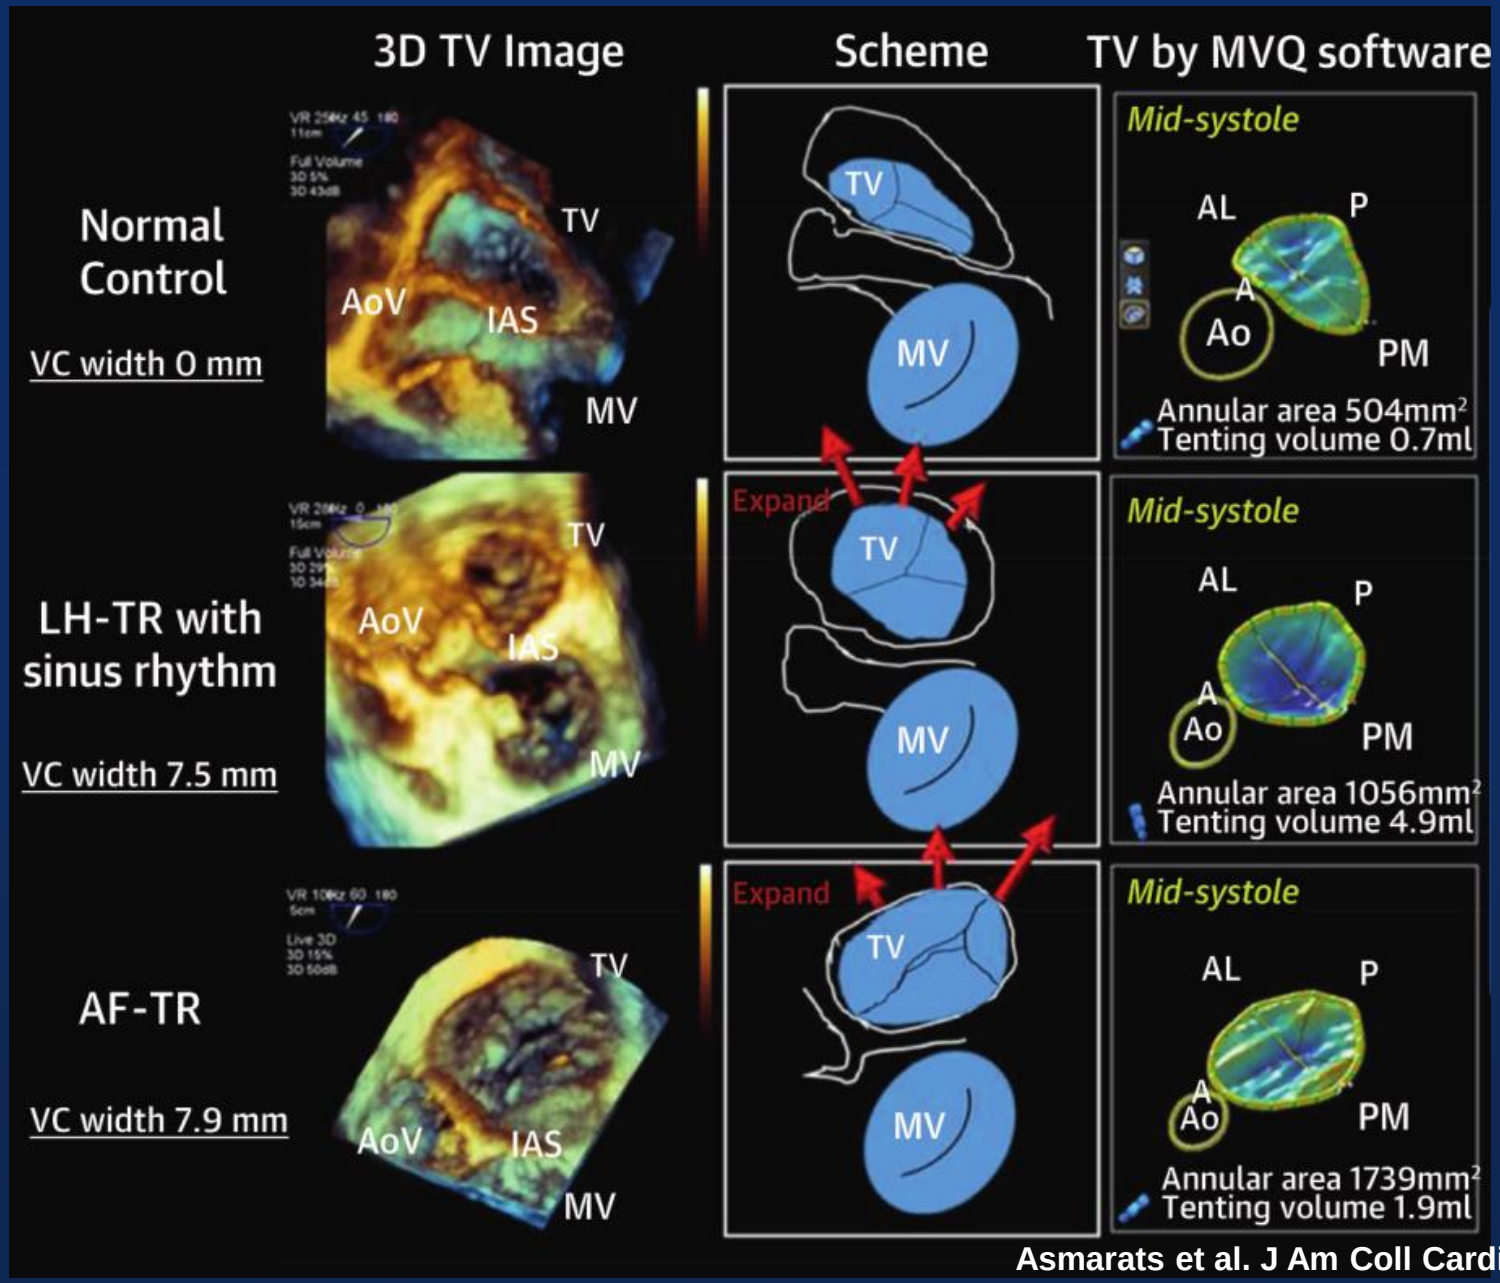
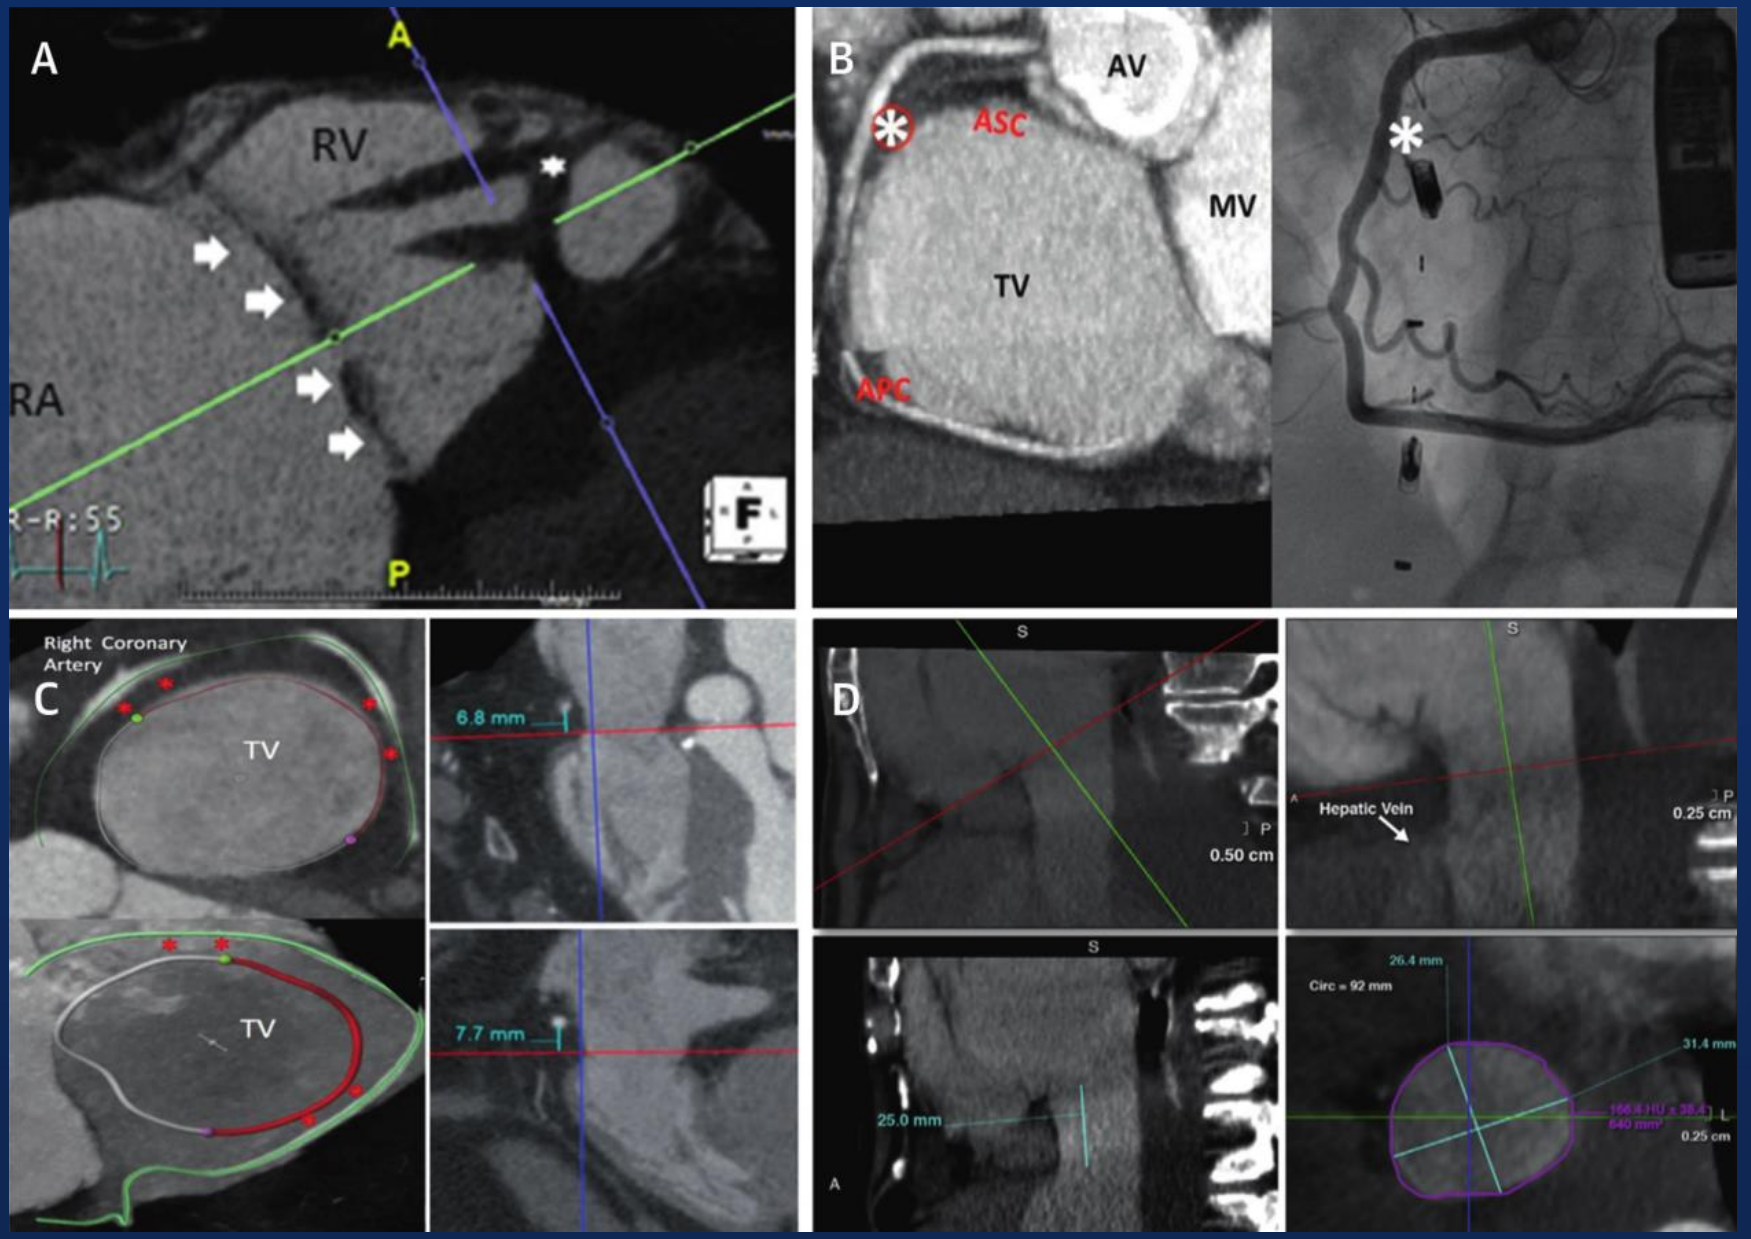
# Pathoanatomy of Functional TR



Asmarats et al. J Am Coll Cardiol. 2018;71(25):2935-56

# CT Pre-Procedural Workup

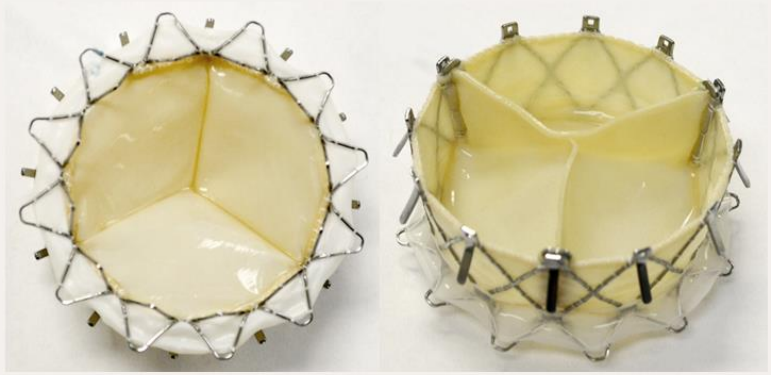


Asmarats et al. J Am Coll Cardiol. 2018;71(25):2935-56

# Key Considerations During Orthotopic TTVR

- Tricuspid annular dimensions (anteroposterior and septal-lateral diameters, perimeter, area)
- Right internal jugular vein and SVC size
- Course of the RCA relative to the TA
- Distance from RCA to the anterior and posterior tricuspid leaflet insertion
- Risk for RVOT obstruction

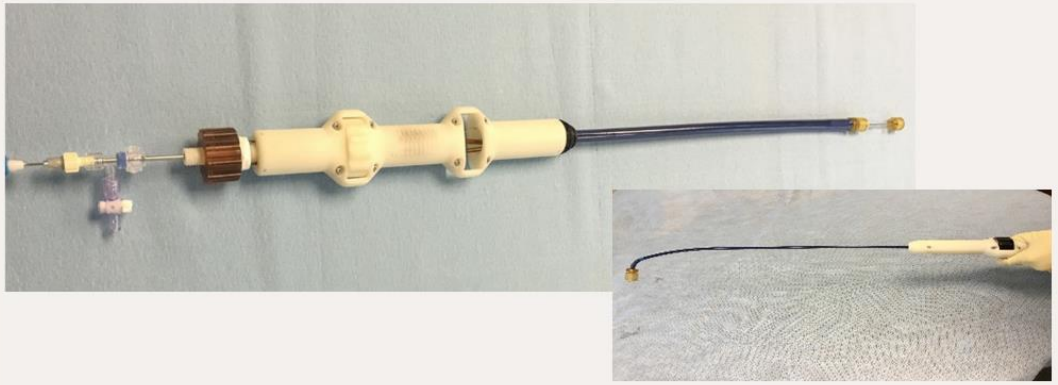
# Orthotopic TTVR
# NaviGate Tricuspid Valved Stent



## Components Specifications

- Temperature Shape Memory NiTinol Tapered Stent
- Height profile 21mm, Truncated Cone configuration
- Annular Winglets for secure anchoring of TV annulus and tricuspid valve leaflets
- Sizes = 36mm, 40mm, 44mm, 48mm, and 52mm.
- Chemically Preserved Xenogeneic Pericardium

## Delivery System



- Presently 35F at the distal capsule
- 24F catheter shaft
- Two degrees of motion at tip
- 80° Articulation
- Controlled Valve Release
- The delivery use the same valve configuration

Asmarats et al. J Am Coll Cardiol. 2018;71(25):2935-56

# VIVID Registry –TVIV
## Summary

- Tricuspid valve-in-valve procedures are increasingly performed using Melody and SAPIEN XT/ SAPIEN 3 THV devices.
- Although half the patients had etiology of congenital heart disease, most of them were adults at the time of VinV.
- Specific considerations in these cases include tx of large surgical valves, coaxilaity issues and transvalvular pacemaker leads.
- SAPIEN and Melody implantation for this indication show similar clinical outcomes.

## Echocardiographic Characteristics

| | N=312 |
|---|---|
| Right atrial volume (ml) | 111 ± 82 |
| LV Ejection Fraction (%) | 49 ± 13 |
| Tricuspid Vena Contracta (cm) | 1.1 ± 0.5 |
| Tricuspid Regurgitant Volume (ml) | 54 ± 34 |
| Tricuspid Antero-Septal diameter (mm) | 46.9 ± 9 |
| Tricuspid EROA (mm2) | 80 ± 60 |
| TAPSE (mm) | 16.2 ± 5 |
| S-TDI (cm/sec) | 10 ± 7 |
| Coaptation Depth (mm) | 9.5 ± 4.1 |
| Tenting Area (cm2) | 2.8 ± 1.7 |
| Systolic Pulmonary Artery Pressure (mmHg) | 41 ± 15 |

*Values are mean (SD)*

Taramasso M, et al. J Am Coll Cardiol Intv 2019;12:155–65

# Echocardiographic Assessment of TR Severity

| Current recommendations for grading the severity of chronic TR[1] | | | |
|---|---|---|---|
| **Parameters** | **Mild** | **Moderate** | **Severe** |
| Structural | | | |
| TV morphology | Normal or mildly abnormal leaflets | Moderately abnormal leaflets | Severe valve lesions |
| RV and RA size | Usually normal | Normal or mild dilatation | Usually dilated |
| IVC diameter | Normal < 2 cm | Normal or mildly dilated 2.1-2.5 cm | Dilated > 2.5 cm |
| Qualitative | | | |
| Color flow jet area | Small, narrow, central | Moderate central | Large central jet or eccentric wall-impinging jet |
| Flow convergence zone | Not visible, transient or small | Intermediate | Large throughout systole |
| CWD jet | Faint/partial/parabolic | Dense, parabolic or triangular | Dense, often triangular |
| Semi-quantitative | | | |
| Color flow jet area ($cm^2$) | Not defined | Not defined | >10 |
| VCW (cm) | <0.3 | 0.3-0.69 | ≥0.7 |
| PISA radius (cm) | ≤0.5 | 0.6-0.9 | >0.9 |
| Hepatic vein flow | Systolic dominance | Systolic blunting | Systolic flow reversal |
| Tricuspid inflow | A-wave dominant | Variable | E-wave >1.0 m/sec |
| Quantitative | | | |
| EROA ($mm^2$) | <20 | 20-39 | ≥ 40 |
| RVol (2D PISA) (mL) | <30 | 30-44 | ≥45 |

| Proposed extended grading scheme[2] | | | | | |
|---|---|---|---|---|---|
| **Variable** | **Mild** | **Moderate** | **Severe** | **Massive** | **Torrential** |
| VC (biplane) (mm) | < 3 | 3-6.9 | 7-13 | 14-20 | ≥ 21 |
| EROA (PISA)($mm^2$) | < 20 | 20-39 | 40-59 | 60-79 | ≥ 80 |
| 3D VCA or quantitative EROA($mm^2$) | | | 75-94 | 95-114 | ≥ 115 |

# TriValve Registry
## Procedural and 30-day outcomes

| | N=280 |
|---|---|
| Procedural Success | 204 (72.8) |
| Thirty-day Mortality | 10 (3.6) |
| Major bleeding | 5 (1.7) |
| Stroke | 3 (1.0) |
| Myocardial infarction requiring right coronary artery stenting | 2 (0.7) |
| Conversion to surgery | 4 (1.4) |
| Respiratory failure | 2 (0.7) |
| Device detachment | 1 (0.3) |
| Ventricular arrhythmia | 1 (0.3) |

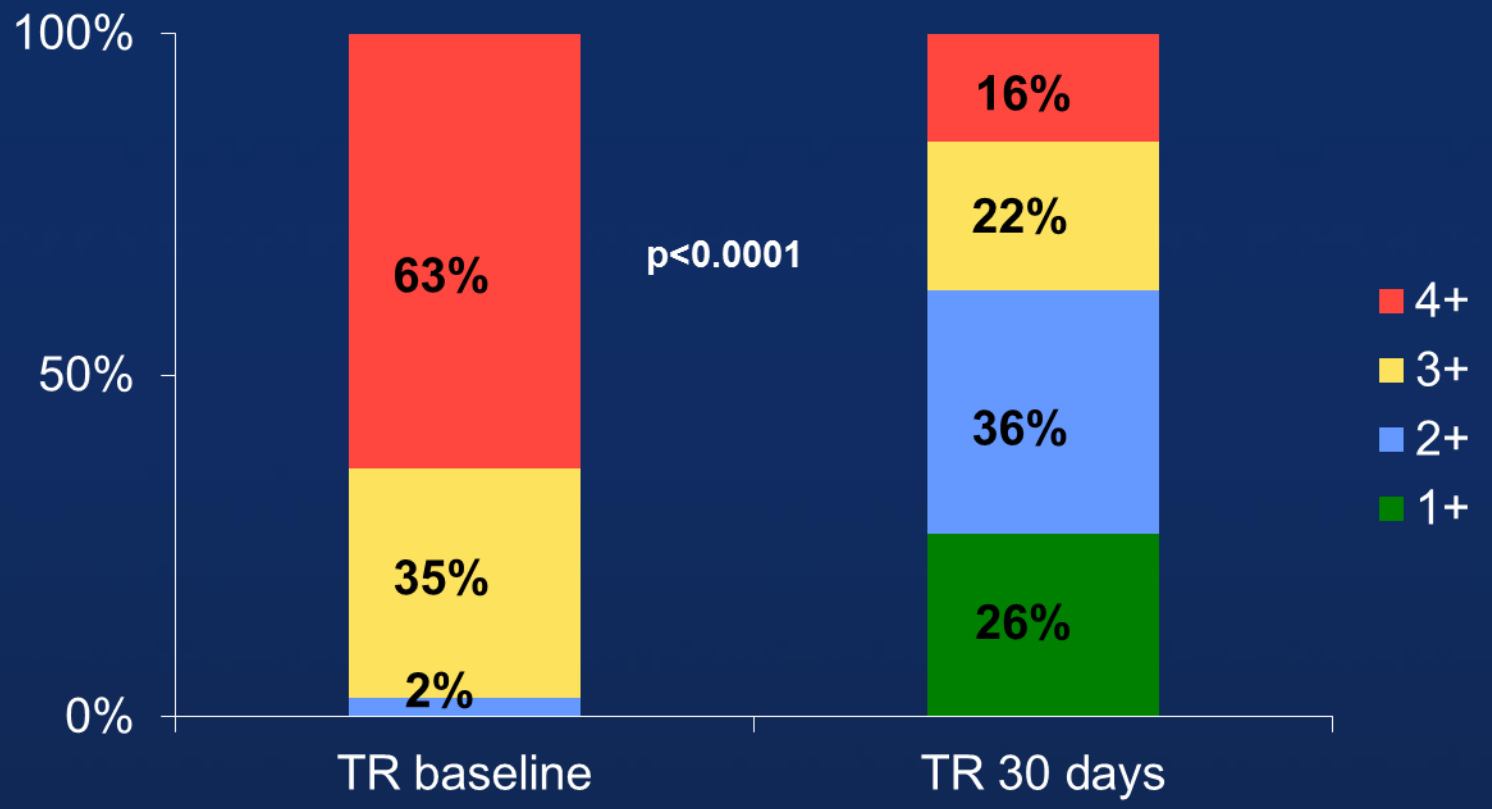
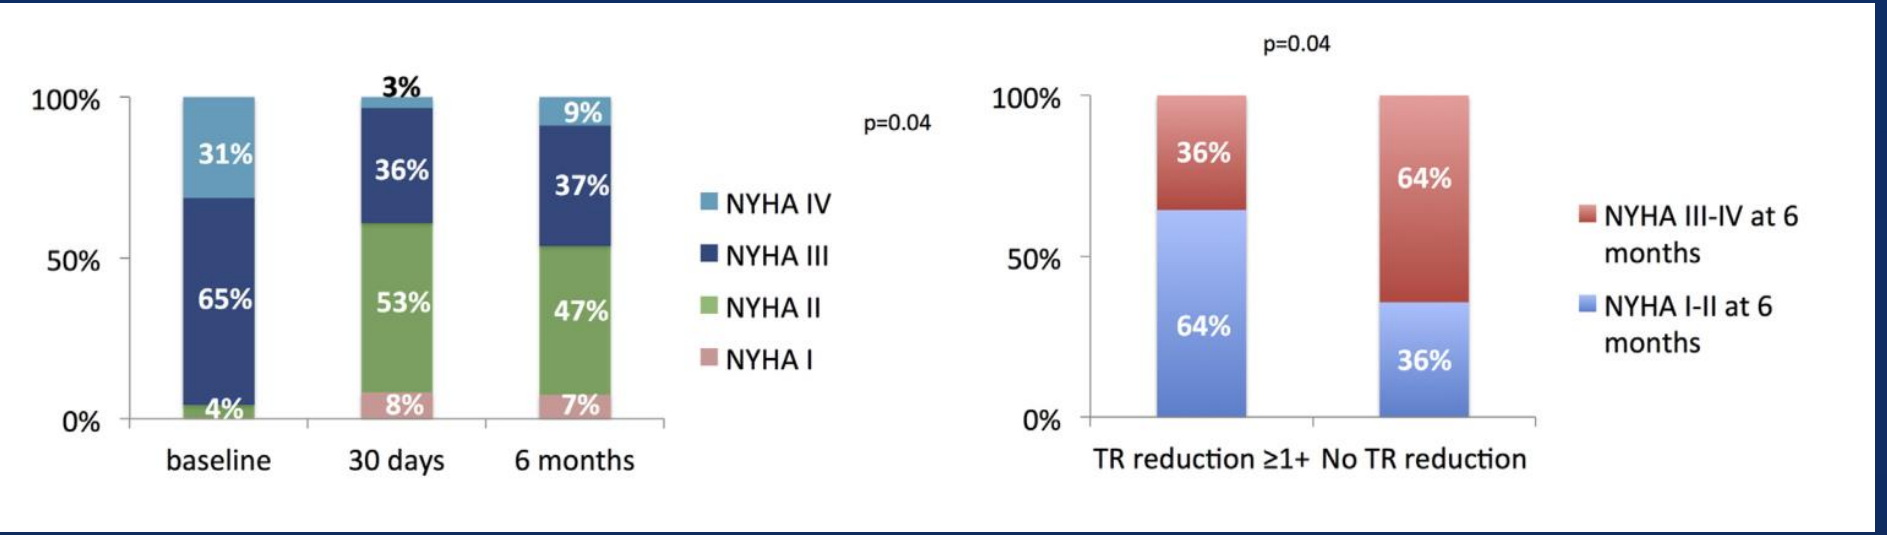
# Transcatheter Therapies for TR

## Reduction in TR Severity



Taramasso M, et al. J Am Coll Cardiol Intv 2019;12:155–65

# Transcatheter Therapies for TR
## Changes in Functional Status

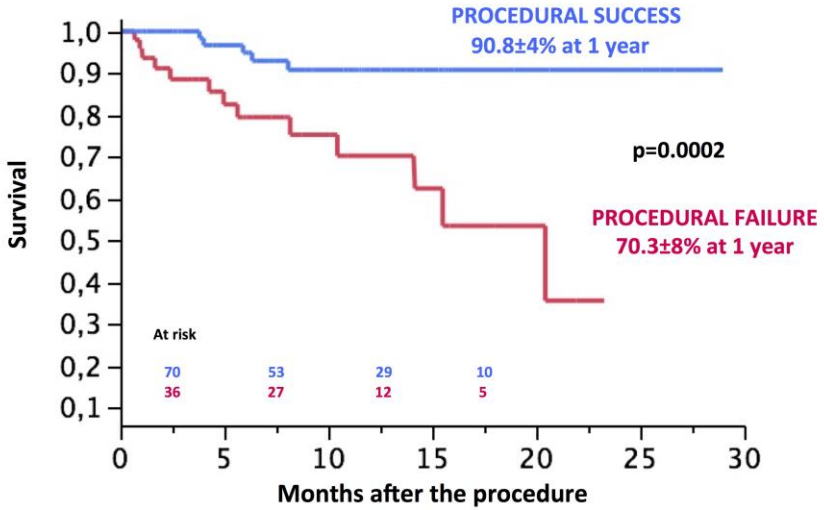


- Patients with ascites: from 27% → 14% (p=0.006)
- Patients with peripheral oedema: from 89% to 39% (p=0.001)

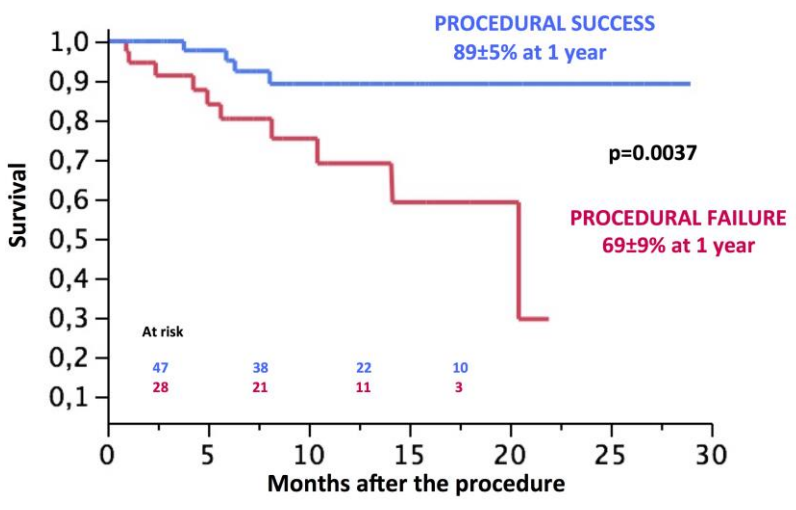
Taramasso M, et al. J Am Coll Cardiol Intv 2019;12:155–65

# TriValve Registry
## Follow-up

### Overall Survival according to Procedural Success



### Survival Isolated TTVI according to Procedural Success



Procedural success and higher values of sPAP at baseline were independently associated with increased mortality at follow-up

# TriValve Registry
## Summary

- Procedural success, defined as successful device implantation and residual TR of ≤ 2+, achieved in 72.8%
- At a median follow-up of 6 months, improvements seen in NYHA class and prevalence of ascites and peripheral edema
- At 1.5 years, the actuarial survival rate was 77.2 ± 5.9%
- Procedural success (HR 0.18) and systolic pulmonary artery pressure (HR 17.0) independently predicted mortality

# TriValve Registry
## Conclusions

- Several challenges in TTVI (anatomy, imaging, clinical, definitions)
- TTVI is feasible with different technologies, with a reasonable overall procedural success rate and it is associated with low mortality and significant clinical improvement
- Mid-term survival is “favorable” in this high risk population
- Patient selection is crucial (anatomical and clinical)

# Ongoing and Future Studies on TTVI

Ongoing studies on transcatheter therapies for tricuspid regurgitation for each devices.

| Device | Name (NCT) | Design | N° patients | TR severity | Surgical risk | Primary outcome |
|---|---|---|---|---|---|---|
| TriClip | TRILUMINATE (NCT03904147) | Randomized, open-label | 700 | Severe or more | Intermediate or more | Hierarchical composite of all-cause mortality or tricuspid valve surgery, rate of heart failure hospitalizations, and quality of life improvement at 12 months |
| PASCAL | CLASP II TR (NCT04097145) | Randomized, open-label | 825 | Severe or more | Intermediate ore more | Hierarchical composite of adverse events including mortality, heart failure hospitalisation, need for tricuspid valve surgery, and improvement of quality of life at 24 months |
| MISTRAL | MATTERS II (NCT04073979) | First-in-man Prospective registry | 10 | Moderate or more | High risk | Acute safety with rate of device related serious adverse events at procedure, 5 and 30 days |
| Trialign | SCOUT II (NCT03225612) | Prospective registry | 60 | Moderate or more | High risk | All-cause mortality at 30 days |
| MIA | STTAR (NCT03692598) | Prospective registry with parallel arms (surgical and percutaneous) | 60 | Moderate or more | Excluded if unacceptable surgical risk | Safety: Major adverse events within 30 days of the procedure including death, cardiac tamponade, MI, cardiac surgery for failed MIA implantation, or stroke<br>Efficacy: Reduction in tricuspid regurgitation at 30 days |
| Cardioband | TriBAND (NCT03779490) | Prospective post-market registry | 150 | Moderate or more | – | Reduction in severity of Tricuspid Regurgitation at discharge. |
| DaVingi | NCT03700918 | First-in-human prospective registry | 15 | Severe or more | – | Safety: device-related serious adverse at 30 days<br>Efficacy: Rate of successful adjustment of the DaVingi ring |
| TricValve | TRICUS STUDY (NCT03723239) | Prospective registry | 10 | n/a | – | Safety: Percentage of participants with major adverse events at 30 days<br>Efficacy: Change of (NYHA) functional class at 6 months |
| Evoque | TRISCEND (NCT04221490) | Early feasibility prospective registry | 200 | Moderate or more | – | Freedom from device or procedure-related adverse events at 30 days |
| | TRISCEND II (NCT04482062) | Randomized, open-label | 775 | Severe or more | – | - TR grade reduction and composite of functional endpoint including: Kansas city cardiomyopathy questionnaire, NYHA functional class, and 6-minute walk test distance improvement at 6 months<br>- Rate of Major adverse events at 30 days<br>- Composite endpoint including all-cause mortality, right ventricle assistance device implantation or heart transplant, tricuspid valve intervention, heart failure hospitalizations, and functional improvement at 1 year |
| LuX-Valve | TRAVEL (NCT04436653) | Prospective registry | 150 | Severe or more | High risk | All-cause death at 1 year.<br>Tricuspid regurgitation reduction at 1 year |
| Cardiovalve | NCT04100720 | Early feasibility prospective registry | 15 | Moderate or more | – | Safety: Patients free of major adverse events at 30 days<br>Efficacy: technical success and tricuspid regurgitation reduction at 30 days |

NYHA: New York Heart Association, TR: tricuspid regurgitation.
